<u>Appendix NA --</u> Nonresidential ACM Approval Application¹

CALIFORNIA ENERGY RESOURCES

CONSERVATION AND DEVELOPMENT COMMISSION

APPLICATION FOR APPROVAL OF A VENDOR-CERTIFIED ALTERNATIVE CALCULATION METHOD FOR USE IN DEMONSTRATING COMPLIANCE WITH THE NONRESIDENTIAL BUILDING ENERGY EFFICIENCY STANDARDS PER SECTION 141, TITLE 24 OF THE CALIFORNIA CODE OF REGULATIONS

Part I:	General Information	
1.	Organization filing application:	
	Name:	Phone: ()
	Address:	_
2.	Name of person responsible for completion of this	application:
	Name:	Phone: ()
	Address:	_
3.	Name, Date, and Version of the Alternative Calcul	– ation Method (ACM):
	Name:	_ Date:
	Version:	_
4.	Has a previous version of this ACM ever been cer	
	[]YES []NO	
5.	Has this ACM been previously submitted for appro	oval or certification?
	[]YES []NO	
6.	Has this ACM ever been used to analyze the ener	gy use of a building in California?
	[] YES [] NO	
7.	Has this ACM ever been used to determine compi California?	ance with the energy efficiency standards of
	[]YES []NO	

Appendix NA - Nonresidential ACM Approval Application

There have been no changes to this Appendix for the Feb. 4, 2003 Workshop draft.

I/We,		, certify that the alte	ernative calcula	tion method (ACM), herein
	name(s)			
designated _		,version		, dated,
	name of alternative calculation method	d	version	last saved update
occupying	bytes	of memory, conforn	ns to all of the r	requirements specified for an
	exact memory size in bytes			
this ACM sur Alternative C standards. N where this AC	nmission approval listed in the Nocessfully conforms to the test or Calculation Method (ACM) App Moreover, I/we certify that, to the CM would indicate compliance for method would indicate fails to co	iteria for each and roval Manual for best of my/our kno a proposed buildin	every ACM c the Nonreside wledge and be g that the refer	apability test in Chapter 4 of ential building energy efficie elief, we have found no instar ence computer program using
required to n access to the that the ACM	derstand that all required inputs nodel the features described by a required inputs and that this AC I cannot model with sufficient ac neet the test criteria for any test of	a given set of inpu CM automatically w ccuracy and autom	ts. I/We stipul arns the user v	ate that this ACM gives the when building inputs use feat

CHAPTER 24

THERMAL AND WATER VAPOR TRANSMISSION DATA

Building Envelopes	. 24.1
Calculating Overall Thermal Resistances	
Mechanical and Industrial Systems	
Calculating Heat Flow for Buried Pipelines	

THIS chapter presents thermal and water vapor transmission data based on steady-state or equilibrium conditions. Chapter 3 covers heat transfer under transient or changing temperature conditions. Chapter 22 discusses selection of insulation materials and procedures for determining overall thermal resistances by simplified methods.

BUILDING ENVELOPES

Thermal Transmission Data for Building Components

The steady-state thermal resistances (R-values) of building components (walls, floors, windows, roof systems, etc.) can be calculated from the thermal properties of the materials in the component; or the heat flow through the assembled component can be measured directly with laboratory equipment such as the guarded hot box (ASTM Standard C 236) or the calibrated hot box (ASTM Standard C 976).

Tables I through 6 list thermal values, which may be used to calculate thermal resistances of building walls, floors, and ceilings. The values shown in these tables were developed under ideal conditions. In practice, overall thermal performance can be reduced significantly by such factors as improper installation and shrinkage, settling, or compression of the insulation (Tye and Desjarlais 1983; Tye 1985, 1986).

Most values in these tables were obtained by accepted ASTM test methods described in ASTM Standards C 177 and C 518 for materials and ASTM Standards C 236 and C 976 for building envelope components. Because commercially available materials vary, not all values apply to specific products.

The most accurate method of determining the overall thermal resistance for a combination of building materials assembled as a building envelope component is to test a representative sample by a hot box method. However, all combinations may not be conveniently or economically tested in this manner. For many simple constructions, calculated R-values agree reasonably well with values determined by hot box measurement.

The performance of materials fabricated in the field is especially subject to the quality of workmanship during construction and installation. Good workmanship becomes increasingly important as the insulation requirement becomes greater. Therefore, some engineers include additional insulation or other safety factors based on experience in their design.

Figure 1 shows how convection affects surface conductance of several materials. Other tests on smooth surfaces show that the average value of the convection part of the surface conductance decreases as the length of the surface increases.

Vapor retarders, which are discussed in Chapters 22 and 23, require special attention. Moisture from condensation or other sources may reduce the thermal resistance of insulation, but the effect of moisture must be determined for each material. For example, some materials with large air spaces are not affected signifi-

The preparation of this chapter is assigned to TC 4.4, Thermal Insulation and Moisture Retarders.

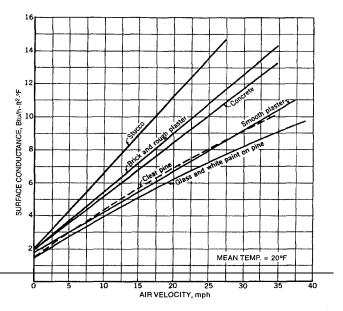

Fig. 1 Surface Conductance for Different Surfaces as Affected by Air Movement

cantly if the moisture content is less than 10% by weight, while the effect of moisture on other materials is approximately linear.

Ideal conditions of components and installations are assumed in calculating overall R-values (i.e., insulating materials are of uniform nominal thickness and thermal resistance, air spaces are of uniform thickness and surface temperature, moisture effects are not involved, and installation details are in accordance with design). The National Institute of Standards and Technology Building Materials and Structures Report BMS 151 shows that measured values differ from calculated values for certain insulated constructions. For this reason, some engineers decrease the calculated R-values a moderate amount to account for departures of constructions from requirements and practices.

Tables 3 and 2 give values for well-sealed systems constructed with care. Field applications can differ substantially from laboratory test conditions. Air gaps in these insulation systems can seriously degrade thermal performance as a result of air movement due to both natural and forced convection. Sabine et al. (1975) found that the tabular values are not necessarily additive for multiple-layer, low-emittance air spaces, and tests on actual constructions should be conducted to accurately determine thermal resistance values.

Values for foil insulation products supplied by manufacturers must also be used with caution because they apply only to systems that are identical to the configuration in which the product was tested. In addition, surface oxidation, dust accumulation, condensation, and other factors that change the condition of the low-emittance surface can reduce the thermal effectiveness of

Table 1 Surface Conductances and Resistances for Air

Matar

- 1. Surface conductance h_i and h_a measured in Btu/h·ft²·°F; resistance R in °F·ft²·h/Btu.
- 2. No surface has both an air space resistance value and a surface resistance value.
- For ventilated attics or spaces above ceilings under summer conditions (heat flow down), see Table 5.
- 4. Conductances are for surfaces of the stated emittance facing virtual blackbody surroundings at the same temperature as the ambient air. Values are based on a surface-air temperature difference of 10°F and for surface temperatures of 70°F.
- See Chapter 3 for more detailed information, especially Tables 5 and 6, and see Figure 1 for additional data.
- 6. Condensate can have a significant impact on surface emittance (see Table 2).

these insulation systems (Hooper and Moroz 1952). Deterioration results from contact with several types of solutions, either acidic or basic (e.g., wet cement mortar or the preservatives found in decay-resistant lumber). Polluted environments may cause rapid and severe material degradation. However, site inspections show a predominance of well-preserved installations and only a small number of cases in which rapid and severe deterioration has occurred. An extensive review of the reflective building insulation system performance literature is provided by Goss and Miller (1989).

CALCULATING OVERALL THERMAL RESISTANCES

Relatively small, highly conductive elements in an insulating layer called thermal bridges can substantially reduce the average thermal resistance of a component. Examples include wood and metal studs in frame walls, concrete webs in concrete masonry walls, and metal ties or other elements in insulated wall panels. The following examples illustrate the calculation of R-values and U-factors for components containing thermal bridges.

These conditions are assumed in calculating the design R-values:

- Equilibrium or steady-state heat transfer, disregarding effects of thermal storage
- · Surrounding surfaces at ambient air temperature
- Exterior wind velocity of 15 mph for winter (surface with R = 0.17°F·ft²·h/Btu) and 7.5 mph for summer (surface with R = 0.25°F·ft²·h/Btu)
- · Surface emittance of ordinary building materials is 0.90

Wood Frame Walls

The average overall R-values and U-factors of wood frame walls can be calculated by assuming either parallel heat flow paths through areas with different thermal resistances or by assuming isothermal planes. Equations (1) through (5) from Chapter 22 are used.

1997 ASHRAE Fundamentals Handbook

Table 2 Emittance Values of Various Surfaces and Effective Emittances of Air Spaces^a

		Effective Emittance ε _{eff} of Air Space				
Surface	Average Emittance ε	One Surface Emittance ε; Other, 0.9	Both Surfaces Emittance ε			
Aluminum foil, bright	0.05	0.05	0.03			
Aluminum foil, with condensate just visible (> 0.7 gr/ft ²)	0.30 ^b	0.29				
Aluminum foil, with condensate clearly visible (> 2.9 gr/ft ²)	0.70 ^b	0.65	_ ,			
Aluminum sheet	0.12	0.12	0.06			
Aluminum coated paper, polished	0.20	0.20	0.11			
Steel, galvanized, bright	0.25	0.24	0.15

Building materials: wood, paper, masonry, nonmetallic paints	0.90	0.82	0.82			
Regular glass	0.84	0.77	0.72			

- ^aThese values apply in the 4 to 40 µm range of the electromagnetic spectrum. ^bValues are based on data presented by Bassett and Trethowen (1984).
- 1. Outside surface
 2. Wood bevel lapped siding
 3. Sheathing (rigid foam insulation)
 4. Mineral fiber batt insulation

Fig. 2 Insulated Wood Frame Wall (Example 1)

The framing factor or fraction of the building component that is framing depends on the specific type of construction, and it may vary based on local construction practices—even for the same type of construction. For stud walls 16 in. on center (OC), the fraction of insulated cavity may be as low as 0.75, where the fraction of studs, plates, and sills is 0.21 and the fraction of headers is 0.04. For studs 24 in. OC, the respective values are 0.78, 0.18, and 0.04. These fractions contain an allowance for multiple studs, plates, sills, extra framing around windows, headers, and band joists. These assumed framing fractions are used in the following example, to illustrate the importance of including the effect of framing in determining the overall thermal conductance of a building. The actual framing fraction should be calculated for each specific construction.

^aSee Chapter 22, section Factors Affecting Heat Transfer across Air Spaces. Thermal a See Chapter 22, section Factors Affecting Heat Transfer across Air Spaces. Thermal resistance values were determined from the relation, R = 1/C, where $C = h_c + \varepsilon_{eff} h_c$, h_c , is the conduction-convection coefficient $\varepsilon_{eff} h_c$, is the radiation coefficient ε 0.0068 $\varepsilon_{eff} [(t_m + 460)/100]^3$, and t_m is the mean temperature of the air space. Values for h_c were determined from data developed by Robinson et al. (1954). Equations (5) through (7) in Yarbrough (1983) show the data in this table in analytic form. For extrapolation from this table to air spaces less than 0.5 in. (as in insulating window glass), assume $h_c = 0.159(1 + 0.0016 t_m)t$ where t is the air space thickness in inches, and h_c is heat transfer through the air space only. Values are based on data presented by Robinson et al. (1954). (Also see Chapter 3, Tables 3 and 4, and Chapter 36). Values apply for ideal conditions, i.e., air spaces of uniform thickness bounded by plane, smooth, parallel surfaces with no air leakage to or from the space. When accurate values are required, use overall t L-factors deter-

or from the space. When accurate values are required, use overall U-factors deter-

mined through calibrated hot box (ASTM C 976) or guarded hot box (ASTM C 236) testing. Thermal resistance values for multiple air spaces must be based on careful estimates of mean temperature differences for each air space.

^cA single resistance value cannot account for multiple air spaces; each air space requires a separate resistance calculation that applies only for the established boundary conditions. Resistances of horizontal spaces with heat flow downward are substantially independent of temperature difference.

^dInterpolation is permissible for other values of mean temperature, temperature difference, and effective emittance ϵ_{eff} . Interpolation and moderate extrapolation for air spaces greater than 3.5 in. are also permissible.

[&]quot;Effective emittance ε_{eff} of the air space is given by $1/\varepsilon_{eff} = 1/\varepsilon_1 + 1/\varepsilon_2 - 1$, where ε_1 and ε_2 are the emittances of the surfaces of the air space (see Table 2).

1997 ASHRAE Fundamentals Handbook

Notes for Table 4

- ^aValues are for a mean temperature of 75°F. Representative values for dry materials are intended as design (not specification) values for materials in normal use. Thermal values of insulating materials may differ from design values depending on their in-situ properties (e.g., density and moisture content, orientation, etc.) and variability experienced during manufacture. For properties of a particular product, use the value supplied by the manufacturer or by unbiased tests.
- ^bTo obtain thermal conductivities in Btu/h·ft·°F, divide the *k*-factor by 12 in/ft.
- ^cResistance values are the reciprocals of C before rounding off C to two decimal places.
- ^dLewis (1967).
- ^eU.S. Department of Agriculture (1974).
- ^fDoes not include paper backing and facing, if any. Where insulation forms a boundary (reflective or otherwise) of an airspace, see Tables 2 and 3 for the insulating value of an airspace with the appropriate effective emittance and temperature conditions of the space.
- ^gConductivity varies with fiber diameter. (See Chapter 22, Factors Affecting Thermal Performance.) Batt, blanket, and loose-fill mineral fiber insulations are manufactured to achieve specified R-values, the most common of which are listed in the table. Due to differences in manufacturing processes and materials, the product thicknesses, densities, and thermal conductivities vary over considerable ranges for a specified R-value.
- ^hThis material is relatively new and data are based on limited testing.
- ⁱFor additional information, see Society of Plastics Engineers (SPI) Bulletin U108. Values are for aged, unfaced board stock. For change in conductivity with age of expanded polyurethane/polyisocyanurate, see Chapter 22, Factors Affecting Thermal Performance.
- JValues are for aged products with gas-impermeable facers on the two major surfaces. An aluminum foil facer of 0.001 in, thickness or greater is generally considered impermeable to gases. For change in conductivity with age of expanded polyisocyanurate, see Chapter 22, Factors Affecting Thermal Performance, and SPI Bulletin U108.
- kCellular phenolic insulation may no longer be manufactured. The thermal conductivity and resistance values do not represent aged insulation, which may have a higher thermal conductivity and lower thermal resistance.
- ¹Insulating values of acoustical tile vary, depending on density of the board and on type, size, and depth of perforations.

- ^mCavity is framed with 0.75 in. wood furring strips. Caution should be used in applying this value for other framing materials. The reported value was derived from tests and applies to the reflective path only. The effect of studs or furring strips must be included in determining the overall performance of the wall.
- Nalues for fully grouted block may be approximated using values for concrete with a similar unit weight.
- OValues for concrete block and concrete are at moisture contents representative of normal use.
- PValues for metal or vinyl siding applied over flat surfaces vary widely, depending on amount of ventilation of airspace beneath the siding; whether airspace is reflective or nonreflective; and on thickness, type, and application of insulating backing used. Values are averages for use as design guides, and were obtained from several guarded hot box tests (ASTM C 236) or calibrated hot box (ASTM C 976) on hollow-backed types and types made using backing-boards of wood fiber, foamed plastic, and glass fiber. Departures of ±50% or more from these values may occur.

 qVinyl specific heat = 0.25 Btu/lb.°F
- See Adams (1971), MacLean (1941), and Wilkes (1979). The conductivity values listed are for heat transfer across the grain. The thermal conductivity of wood varies linearly with the density, and the density ranges listed are those normally found for the wood species given. If the density of the wood species is not known, use the mean conductivity value. For extrapolation to other moisture contents, the following empirical equation developed by Wilkes (1979) may be used:

$$k = 0.1791 + \frac{(1.874 \times 10^{-2} + 5.753 \times 10^{-4} M)\rho}{1 + 0.01 M}$$

- where ρ is density of the moist wood in lb/ft³, and M is the moisture content in percent.
- From Wilkes (1979), an empirical equation for the specific heat of moist wood at 75°F is as follows:

$$c_p = \frac{(0.299 + 0.01M)}{(1 + 0.01M)} + \Delta c_p$$

where Δc_p accounts for the heat of sorption and is denoted by

$$\Delta c_p = M(1.921 \times 10^{-3} - 3.168 \times 10^{-5} M)$$

where M is the moisture content in percent by mass.

Solution. Obtain the R-values of the various building elements from Tables I and 4. Assume the R = 1.25 per inch for the wood framing. Also, assume the headers are solid wood, in this case, and group them with the studs, plates, and sills.

Element	R (Insulated Cavity)	R (Studs, Plates, and Headers)
1. Outside surface, 15 mphwind	0.17	0.17
2. Wood bevel lapped siding	0.81	0.81
3. Rigid foam insulating sheathing	4.0	4.0
4. Mineral fiber batt insulation, 3.5 in.	13.0	
5. Wood stud, nominal 2 × 4	_	4.38
6. Gypsum wallboard, 0.5 in.	0.45	0.45
7. Inside surface, still air	0.68	0.68
	$R_1 = 19.11$	$R_2 = 10.49$

Since the U-factor is the reciprocal of R-value, $U_1 = 0.052$ and $U_2 = 0.095$ Btu/h·ft². °F.

If the wood framing (thermal bridging) is not included, Equation (3) from Chapter 22 may be used to calculate the U-factor of the wall as follows:

$$U_{uv} = U_1 = \frac{1}{R_1} = 0.052 \text{ Btu/h} \cdot \text{ft}^2 \cdot \text{°F}$$

If the wood framing is accounted for using the parallel-path flow method, the U-factor of the wall is determined using Equation (5) from Chapter 22 as follows:

$$U_{av} = (0.75 \times 0.052) + (0.25 \times 0.095) = 0.063 \text{ Btu/h} \cdot \text{ft}^2 \cdot {}^{\circ}\text{F}$$

If the wood framing is included using the isothermal planes method, the U-factor of the wall is determined using Equations (2) and (3) from Chapter 22 as follows:

$$R_{T(av)} = 4.98 + 1/[(0.75/13.0) + (0.25/4.38)] + 1.13$$

$$= 14.82 \text{°F} \cdot \text{ft}^2 \cdot \text{h/Btu}$$

$$U_{av} = 0.067 \text{ Btu/h} \cdot \text{ft}^2 \cdot \text{°F}$$

For a frame wall with a 24-in. OC stud space, the average overall R-value is 15.18°F·ft²-h/Btu. Similar calculation procedures may be used to evaluate other wall designs, except those with thermal bridges.

Masonry Walls

The average overall R-values of masonry walls can be estimated by assuming a combination of layers in series, one or more of which provides parallel paths. This method is used because heat flows laterally through block face shells so that transverse isothermal planes result. Average total resistance $R_{T(av)}$ is the sum of the resistances of

the layers between such planes, each layer calculated as shown in Example 2.

Example 2. Calculate the overall thermal resistance and average U-factor of the 7-5/8-in, thick insulated concrete block wall shown in Figure 3. The two-core block has an average web thickness of 1-in, and a face shell thickness of 1-1/4-in. Overall block dimensions are 7-5/8 by 7-5/8 by 15-5/8 in. Measured thermal resistances of 112 lb/ft³ concrete and 7 lb/ft³ expanded perlite insulation are 0.10 and 2.90°F·ft²·h/Btu per inch, respectively.

Solution. The equation used to determine the overall thermal resistance of the insulated concrete block wall is derived from Equations (2) and (5) from Chapter 22 and is given below:

$$R_{T(av)} = R_i + R_f + \left(\frac{a_w}{R_w} + \frac{a_c}{R_c}\right)^{-1} + R_o$$

where

 $R_{T(av)}$ = overall thermal resistance based on assumption of isothermal planes

 R_i = thermal resistance of inside air surface film (still air)

 R_o = thermal resistance of outside air surface film (15 mph wind)

 R_f = total thermal resistance of face shells

 R_c' = thermal resistance of cores between face shells

 R_w^{t} = thermal resistance of webs between face shells

 a_w = fraction of total area transverse to heat flow represented by webs of blocks

 a_c = fraction of total area transverse to heat flow represented by cores of blocks

From the information given and the data in Table 1, determine the values needed to compute the overall thermal resistance.

 $R_i = 0.68$

 $R_o = 0.17$

 $R_f = (2)(1.25)(0.10) = 0.25$

 $R_c = (5.125)(2.90) = 14.86$

 $R_w = (5.125)(0.10) = 0.51$ $a_w = 3/15.625 = 0.192$

 $a_c = 12.625/15.625 = 0.808$

Using the equation given, the overall thermal resistance and average U-factor are calculated as follows:

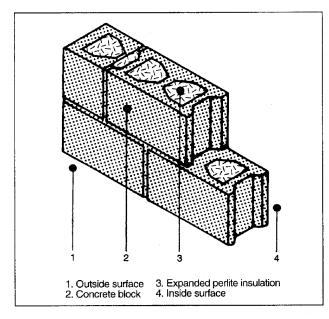

Fig. 3 Insulated Concrete Block Wall (Example 2)

24.9

$$\begin{split} R_{T(av)} &= 0.68 + 0.25 + \frac{0.51 \times 14.86}{(0.808 \times 0.51) + (0.192 \times 14.86)} + 0.17 \\ &= 3.43 \,^{\circ}\text{F} \cdot \text{ft}^{2} \cdot \text{h/Btu} \\ U_{av} &= 1/3.43 = 0.29 \,\, \text{Btu/h} \cdot \text{ft}^{2} \cdot \,^{\circ}\text{F} \end{split}$$

Based on guarded hot box tests of this wall without mortar joints, Tye and Spinney (1980) measured the average R-value for this insulated concrete block wall as 3.13°F·ft²·h/Btu.

Assuming parallel heat flow only, the calculated resistance is higher than that calculated on the assumption of isothermal planes. The actual resistance generally is some value between the two calculated values. In the absence of test values, examination of the construction usually reveals whether a value closer to the higher or lower calculated R-value should be used. Generally, if the construction contains a layer in which lateral conduction is high compared with transmittance through the construction, the calculation with isothermal planes should be used. If the construction has no layer of high lateral conductance, the parallel heat flow calculation should be used.

Hot box tests of insulated and uninsulated masonry walls constructed with block of conventional configuration show that thermal resistances calculated using the isothermal planes heat flow method agree well with measured values (Van Geem 1985, Valore 1980, Shu et al. 1979). Neglecting horizontal mortar joints in conventional block can result in thermal transmittance values up to 16% lower than actual, depending on the density and thermal properties of the masonry, and 1 to 6% lower, depending on the core insulation material (Van Geem 1985, McIntyre 1984). For aerated concrete block walls, other solid masonry, and multicore block walls with full mortar joints, neglecting mortar joints can cause errors in R-values up to 40% (Valore 1988). Horizontal mortar joints usually found in concrete block wall construction are neglected in Example 2.

Constructions Containing Metal

Curtain and metal stud-wall constructions often include metallic and other thermal bridges, which can significantly reduce the thermal resistance. However, the capacity of the adjacent facing materials to transmit heat transversely to the metal is limited, and some contact resistance between all materials in contact limits the reduction. Contact resistances in building structures are only 0.06 to 0.6°F·ft²-h/Btu—too small to be of concern in many cases. However, the contact resistances of steel framing members may be important. Also, in many cases (as illustrated in Example 3), the area of metal in contact with the facing greatly exceeds the thickness of the metal, which mitigates the contact reistance effects.

Thermal characteristics for panels of sandwich construction can be computed by combining the thermal resistances of the various layers. However, few panels are true sandwich constructions; many have ribs and stiffeners that create complicated heat flow paths. R-values for the assembled sections should be determined on a representative sample by using a hot box method. If the sample is a wall section with air cavities on both sides of fibrous insulation, the sample must be of representative height since convective airflow can contribute significantly to heat flow through the test section. Computer modeling can also be useful, but all heat transfer mechanisms must be considered.

In Example 3, the metal member is only 0.020 in. thick, but it is in contact with adjacent facings over a 1.25 in.-wide area. The steel member is 3.50 in. deep, has a thermal resistance of approximately 0.011°F·ft²-h/Btu, and is virtually isothermal. The calculation involves careful selection of the appropriate thickness for the steel member. If the member is assumed to be 0.020 in. thick, the fact that the flange transmits heat to the adjacent facing is ignored, and the heat flow through the steel is underestimated. If the member is assumed to be 1.25 in. thick, the heat flow through the steel is overestimated. In Example 3, the steel member behaves in much the

same way as a rectangular member 1.25 in, thick and 3.50 in, deep with a thermal resistance of $(1.25/0.020) \times 0.011 = 0.69^{\circ} F \cdot ft^2 \cdot h/Btu$ does. The Building Research Association of New Zealand (BRANZ) commonly uses this approximation.

Example 3. Calculate the C-factor of the insulated steel frame wall shown in Figure 4. Assume that the steel member has an R-value of 0.69°F·ft²-h/Btu and that the framing behaves as though it occupies approximately 8% of the transmission area.

Solution. Obtain the R-values of the various building elements from Table 4.

Element	R (Insul.)	R (Framing)
1. 0.5-in. gypsum wallboard	0.45	0.45
2. 3.5-in. mineral fiber batt insulation	11	
3. Steel framing member		0.69
4. 0.5-in. gypsum wallboard	0.45	0.45
	$R_1 = 11.90$	$R_2 = 1.59$

Therefore, $C_1 = 0.084$; $C_2 = 0.629$ Btu/h·ft²·°F.

If the steel framing (thermal bridging) is not considered, the C-factor of the wall is calculated using Equation (3) from Chapter 22 as follows:

$$C_{av} = C_1 = 1/R_1 = 0.084 \text{ Btu/h} \cdot \text{ft}^2 \cdot {}^{\circ}\text{F}$$

If the steel framing is accounted for using the parallel flow method, the C-factor of the wall is determined using Equation (5) from Chapter 22 as follows:

$$C_{av} = (0.92 \times 0.084) + (0.08 \times 0.629)$$

= 0.128 Btu/h·ft²·°F
 $R_{T(av)} = 7.81$ °F·ft²·h/Btu

If the steel framing is included using the isothermal planes method, the C-factor of the wall is determined using Equations (2) and (3) from Chapter 22 as follows:

$$R_{T(a\nu)} = 0.45 + 1/[(0.92/11.00) + (0.08/0.69)] + 0.45$$

= 5.91°F · ft² · h/Btu
 $C_{a\nu} = 0.169$ Btu/h · ft² · °F

For this insulated steel frame wall, Farouk and Larson (1983) measured an average R-value of 6.61 $^{\circ}F\cdot ft^{2}\cdot h/Btu.$

In ASHRAE/IESNA Standard 90.1-1989, one method given for determining the thermal resistance of wall assemblies containing metal framing involves using a parallel path correction factor F_c , which is listed in Table 8C-2 of the standard. For 2 by 4 steel framing, 16 in. OC, $F_c = 0.50$. Using the correction factor method, an

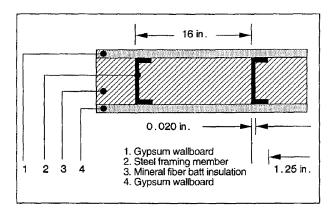

Fig. 4 Insulated Steel Frame Wall (Example 3)

1997 ASHRAE Fundamentals Handbook

R-value of $6.40^{\circ}\text{F}\cdot\text{ft}^2\cdot\text{h/Btu}$ [0.45 + 11(0.50) + 0.45] is obtained for the wall described in Example 3.

Zone Method of Calculation

For structures with widely spaced metal members of substantial cross-sectional area, calculation by the isothermal planes method can result in thermal resistance values that are too low. For these constructions, the **zone method** can be used. This method involves two separate computations—one for a chosen limited portion, Zone A, containing the highly conductive element; the other for the remaining portion of simpler construction, Zone B. The two computations are then combined using the parallel flow method, and the average transmittance per unit overall area is calculated. The basic laws of heat transfer are applied by adding the area conductances *CA* of elements in parallel, and adding area resistances *R/A* of elements in series

The surface shape of Zone A is determined by the metal element. For a metal beam (see Figure 5), the Zone A surface is a strip of width W that is centered on the beam. For a rod perpendicular to panel surfaces, it is a circle of diameter W. The value of W is calculated from Equation (1), which is empirical. The value of d should not be less than 0.5 in. for still air.

$$W = m + 2d \tag{1}$$

where

m =width or diameter of metal heat path terminal, in.

d = distance from panel surface to metal, in.

Generally, the value of W should be calculated using Equation (1) for each end of the metal heat path; the larger value, within the limits of the basic area, should be used as illustrated in Example 4.

Example 4. Calculate transmittance of the roof deck shown in Figure 5. Tee-bars at 24 in. OC support glass fiber form boards, gypsum concrete, and built-up roofing. Conductivities of components are: steel, 314.4 Btu-in/h-ft²-°F; gypsum concrete, 1.66 Btu-in/h-ft²-°F; and glass fiber form board, 0.25 Btu-in/h-ft²-°F. Conductance of built-up roofing is 3.00 Btu/h-ft²-°F.

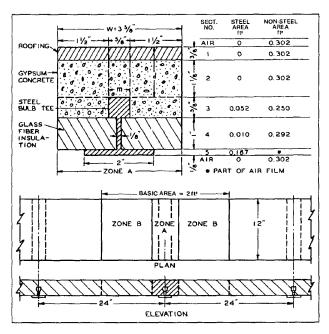

Fig. 5 Gypsum Roof Deck on Bulb Tees (Example 4)

Solution. The basic area is 2 ft² (24 in. by 12 in.) with a tee-bar (12 in. long) across the middle. This area is divided into Zones A and B. Zone A is determined from Equation (1) as follows:

Top side
$$W = m + 2d = 0.625 + (2 \times 1.5) = 3.625$$
 in.
Bottom side $W = m + 2d = 2.0 + (2 \times 0.5) = 3.0$ in.

Using the larger value of W, the area of Zone A is $(12 \times 3.625)/144 = 0.302$ ft². The area of Zone B is 2.0 - 0.302 = 1.698 ft².

To determine area transmittance for Zone A, divide the structure within the zone into five sections parallel to the top and bottom surfaces (Figure 5). The area conductance CA of each section is calculated by adding the area conductances of its metal and nonmetal paths. Area conductances of the sections are converted to area resistances RIA and added to obtain the total resistance of Zone A.

Section	Area	×	Conductance	e = CA		$\frac{1}{CA} = \frac{R}{A}$	
Air (outside, 15 mph)	0.302	×	6.00	1.81		0.55	
No. 1, Roofing	0.302	×	3.00	0.906		1.10	
No. 2, Gypsum concrete	0.302	×	1.66/1.125	0.446		2.24	
No. 3, Steel	0.052	×	314.4/0.625	26.2	1	0.04	
No. 3, Gypsum concrete	0.250	×	1.66/0.625	0.664	ſ	0.04	
No. 4, Steel	0.010	×	314.4/1.00	3.14	1	0.31	
No. 4, Glass fiberboard	0.292	×	0.25/1.00	0.073	ſ	0.31	
No. 5, Steel	0.167	×	314.4/0.125	420.0		0.002	
Air (inside)	0.302	×	1.63	0.492		2.03	
				Total $R/A = 6.27$			

Area transmittance of Zone A = 1/(R/A) = 1/6.27 = 0.159.

For Zone B, the unit resistances are added and then converted to area transmittance, as shown in the following table.

Section	Resistance, R
Air (outside, 15 mph)	1/6.00 = 0.17
Roofing	1/3.00 = 0.33
Gypsum concrete	1.75/1.66 = 1.05
Glass fiberboard	1.00/0.25 = 4.00
Air (inside)	1/1.63 = 0.61
Total resistance	= 6.16

Since unit transmittance = 1/R = 0.162, the total area transmittance *UA* is calculated as follows:

Zone B =
$$1.698 \times 0.162 = 0.275$$

$$Zone A = 0.159$$

Total area transmittance of basic area = 0.434

Transmittance per $ft^2 = 0.434/2.0 = 0.217$

Resistance per $ft^2 = 4.61$

Overall R-values of 4.57 and 4.85°F· ft^2 ·h/Btu have been measured in two guarded hot box tests of a similar construction.

When the steel member represents a relatively large proportion of the total heat flow path, as in Example 4, detailed calculations of resistance in sections 3, 4, and 5 of Zone A are unnecessary; if only the steel member is considered, the final result of Example 4 is the same. However, if the heat flow path represented by the steel member is small, as for a tie rod, detailed calculations for sections 3, 4, and 5 are necessary. A panel with an internal metallic structure and bonded on one or both sides to a metal skin or covering presents special problems of lateral heat flow not covered in the zone method.

Modified Zone Method for Metal Stud Walls with Insulated Cavities

The modified zone method is similar to the parallel path method and the zone method. All three methods are based on parallel-path calculations. Figure 6 shows the width w of the zone of thermal anomalies around a metal stud. This zone can be assumed to equal

24.11

the length of the stud flange L (parallel path method), or can be calculated as a sum of the length of stud flange and a distance double that from wall surface to metal Σd_i (zone method). In the modified zone method the width of the zone depends on the following three parameters:

- Ratio between thermal resistivity of sheathing material and cavity insulation
- · Size (depth) of stud
- · Thickness of sheathing material

The Modified Zone Method is explained in Figure 6 (which can be copied and used as a calculation form). The wall cross section shown in Figure 6, is divided into two zones: the zone of thermal anomalies around metal stud w and the cavity zone cav. Wall material layers are grouped into an exterior and interior surface sections—A (sheathing, siding) and B (wallboard)—and interstitial sections I and II (cavity insulation, metal stud flange).

Assuming that the layers or layer of wall materials in wall section A are thicker than those in wall section B, as show by the cross section in Figure 6, they can be described as follows:

$$\sum_{i=1}^{n} d_i \ge \sum_{j=1}^{m} d_j \tag{2}$$

where

n = number of material layer (of thickness d_i) between metal stud flange and wall surface for section A

m = number of material layer (of thickness d_i) for section B

Then, the width of the zone of thermal anomalies around the metal stud w can be estimated by

$$w = L + z_f \sum_{i=1}^{n} d_i \tag{3}$$

where

L = stud flange size,

 d_i = thickness of material layer in section A

 z_f = zone factor, which is shown in Figure 7 (z_f = 2 for zone method)

Kosny and Christian (1995) verified the accuracy of the Modified Zone Method for over 200 simulated cases of metal frame walls with insulated cavities. For all configurations considered the discrepancy between results were within ±2%. Hot box measured R-values for 15 metal stud walls tested by Barbour et al. (1994) were compared with results obtained by Kosny and Christian (1995) and McGowan and Desjarlais (1997). The Modified Zone Method was found to be the most accurate simple method for estimating the clear wall R-value of light-gage steel stud walls with insulated cavities. However, this analysis does not apply to construction with metal sheathing. Also, ASHRAE Standard 90.1 may require a different method of analysis.

Ceilings and Roofs

The overall R-value for ceilings of wood frame flat roofs can be calculated using Equations (1) through (5) from Chapter 22. Properties of the materials are found in Tables 1, 3, 2, and 4. The fraction of framing is assumed to be 0.10 for joists at 16 in. OC and 0.07 for joists at 24 in. OC. The calculation procedure is similar to that shown in Example 1. Note that if the ceiling contains plane air spaces (see Table 3), the resistance depends on the direction of heat flow, i.e., whether the calculation is for a winter (heat flow up) or summer (heat flow down) condition.

For ceilings of pitched roofs under winter conditions, calculate the R-value of the ceiling using the procedure for flat roofs. Table 5 can be used to determine the effective resistance of the

Representative values for dry materials, which are intended as design (not specification) values for materials in normal use. Insulation materials in actual service may have thermal values that vary from design values depending on their in-situ properties (e.g., density and moisture content). For properties of a particular product, use the value supplied by the manufacturer or by unbiased tests.

^bThese temperatures are generally accepted as maximum. When operating temperature approaches these limits, follow the manufacturers' recommendations.

^cSome polyurethane foams are formed by means that produce a stable product (with respect to k), but most are blown with refrigerant and will change with time.

^dSee Table 4, footnote i. ^cSee Table 4, footnote j.

^aCalculations from ASTM C 680; steel: k = 314.4 Btu·in/h·ft²·°F;

 $\varepsilon = 0.94$

cylindrical surfaces. Figure 9 shows surface resistance as a function of heat transmission for both flat and cylindrical surfaces. The surface emittance is assumed to be 0.85 to 0.90 in still air at 80°F.

Example 7. Compute the heat loss from a boiler wall if the interior insulation surface temperature is 1100°F and ambient still air temperature is 80°F. The wall is insulated with 4.5 in. of mineral fiber block and 0.5 in. of mineral fiber insulating and finishing cement.

Solution. Assume that the mean temperature of the mineral fiber block is 700°F, the mean temperature of the insulating cement is 200°F, and

the surface resistance R_x is 0.60 ft²·°F·h/Btu. From Table 10, $k_1 = 0.62$ and $k_2 = 0.80$. Using Equation (9) from Chapter 22:

$$q_s = \frac{1100 - 80}{(4.5/0.62) + (0.5/0.80) + 0.60} = 120.2 \text{ Btu/h} \cdot \text{ft}^2$$

As a check, from Figure 9, at 120.2 Btu/h·ft², $R_x = 0.56$. The mean temperature of the mineral fiber block is:

$$4.5/0.62 = 7.26$$
; $7.26/2 = 3.63$
 $1100 - \frac{3.63}{8.48}(1020) = 663$ °F

and the mean temperature of the insulating cement is:

$$0.5/0.80 = 0.63$$
; $0.63/2 = 0.31$; $7.26 + 0.31 = 7.57$
 $1100 - \frac{7.57}{8.48}(1020) = 189$ °F

^hLosses per square foot of pipe for pipes larger than 24 in. can be considered the same as losses per square foot for 24-in. pipe.

From Table 10, at 663°F, $k_1 = 0.60$; at 189°F, $k_2 = 0.79$. Using these adjusted values to recalculate q_x :

$$q_s = \frac{1020}{(4.5/0.60) + (0.5/0.79) + 0.56} = \frac{1020}{8.69}$$

= 117.4 Btu/h · ft²

From Figure 9, at 117.4 Btu/h·ft², $R_s = 0.56$. The mean temperature of the mineral fiber block is:

$$4.5/0.6 = 7.50$$
; $7.50/2 = 3.75$
 $1100 - \frac{3.75}{8.69}(1020) = 660$ °F

and the mean temperature of the insulating cement is:

$$0.5/0.79 = 0.63$$
; $0.63/2 = 0.31$; $7.50 + 0.31 = 7.81$
 $1100 - \frac{7.81}{8.69}(1020) = 183$ °F

From Table 10, at 660°F, $k_1 = 0.60$; at 183°F, $k_2 = 0.79$.

Since R_s , k_1 , and k_2 do not change at these values, $q_s = 117.4$ Btu/h·ft.

Example 8. Compute heat loss per square foot of outer surface of insulation if pipe temperature is 1200°F and ambient still air temperature is 80°F. The pipe is nominal 6-in, steel pipe, insulated with a nominal 3-in. thick diatomaceous silica as the inner layer and a nominal 2-in. thick calcium silicate as the outer layer.

^aCalculations from ASTM C 680; for copper: $k = 2784 \text{ Btu·in/h·ft}^2 \cdot \text{°F}$.

Solution. From Chapter 40 of the 1996 ASHRAE Handbook—Equipment, $r_o = 3.31$ in. A nominal 3-in. thick diatomaceous silica insulation to fit a nominal 6-in, steel pipe is 3.02 in. thick. A nominal 2-in. thick calcium silicate insulation to fit over the 3.02-in. diatomaceous silica is 2.08 in. thick. Therefore, $r_i = 6.33$ in. and $r_s = 8.41$ in..

Assume that the mean temperature of the diatomaceous silica is 600° F, the mean temperature of the calcium silicate is 250° F and the surface resistance R_s is 0.50. From Table 10, $k_1 = 0.66$; $k_2 = 0.42$. By Equation (10) from Chapter 22:

$$q_x = \frac{1200 - 80}{[8.41 \ln(6.33/3.31)/0.66] + [8.41 \ln(8.41/3.31)/0.40] + 0.50}$$
$$= \frac{1120}{(5.45/0.66) + (2.39/0.40) + 0.50} = 76.0 \text{ Btu/h} \cdot \text{ft}^2$$

From Figure 9, at 76.0 Btu/h·ft², $R_x = 0.60$. The mean temperature of the diatomaceous silica is:

$$5.45/0.66 = 8.26$$
; $8.26/2 = 4.13$
 $1200 - \frac{4.13}{14.83}(1120) = 888$ °F

and the mean temperature of the calcium silicate is:

$$2.39/0.40 = 5.98$$
; $5.98/2 = 2.99$; $8.26 + 2.99 = 11.25$
 $1200 - \frac{11.25}{14.83}(1120) = 350$ °F

From Table 10, $k_1 = 0.72$; $k_2 = 0.46$. Recalculating:

$$q_s = \frac{1120}{(5.45/0.72) + (2.39/0.46) + 0.60} = 83.8 \text{ Btu/h} \cdot \text{ft}^2$$

From Figure 9 at 83.8 Btu/h·ft², $R_s = 0.59$. The mean temperature of the diatomaceous silica is:

$$5.45/0.72 = 7.57$$
; $7.57/2 = 3.78$
 $1200 - \frac{3.78}{13.36}(1120) = 883$ °F

and the mean temperature of the calcium silicate is:

$$2.39/0.40 = 5.98$$
; $5.98/2 = 2.99$; $8.26 + 2.99 = 11.25$
 $1200 - \frac{11.25}{14.83}(1120) = 350$ °F

From Table 10, $k_1 = 0.72$; $k_2 = 0.46$. Recalculating:

$$2.39/0.46 = 5.20$$
; $5.20/2 = 2.60$; $7.57 + 2.60 = 10.17$
 $1200 - \frac{10.17}{13.36}(1120) = 347$ °F

Since R_x , k_1 , and k_2 do not change at 83.8 Btu/h·ft², this is q_x . The heat flow per \Re^2 of the inner surface of the insulation is:

$$q_o = q_s(r_s/r_o) = 83.8(8.41/3.31) = 213 \text{ Btu/h} \cdot \text{ft}^2$$

Table B-2: Framed Wall Assembly U-values

Table B-2a: Solar Heat Gain Coefficients Used for Exterior Shading¹

Exterior Shading Device	SHGC
Standard Bug Screens	0.76
Exterior Sunscreens with weave 53*16/inch	0.30
Louvered Sunscreens with louvers as wide as openings	0.27
Low Sun Angle (LSA) Louvered Sunscreens	0.13
Roll-down Awning	0.13
Roll Down Blinds or Slats	0.13
None (for skylights only)	1.00

¹⁾ Exterior operable awnings (canvas, plastic or metal), except those that roll vertically down and cover the entire window, should be treated as overhangs for purposes of compliance with the Standards.

Notes

LW CMU is a Light Weight Concrete Masonry Unit per ASTM C 90, Calculated at 105 PCF density

MW CMU is a Medium Weight Concrete Masonry Unit per ASTM C 90, Calculated at 115 PCF density

NW CMU is a Normal Weight Concrete Masonry Unit per ASTM C 90, Calculated at 125 PCF density

Clay Unit is a Hollow Clay Unit per ASTM C 652, Calculated at 130 PCF density

Values include air films on inner and outer surfaces.

Calculations based on Energy Calculations and Data, CMACN, 1986

Grouted Cells at 32" X 48" in Partly Grouted Walls

Table B-910: Illuminance Categories

NOTE: This table is taken from the *Office Lighting American National Standard Practice*. ANSI/IES RP-1, 1993. The table is produced in its entirely, including captions and footnotes. Permission to reprint is pending.

TABLE 3: Currently recommended illuminance categories for lighting design—target maintained values (See Table 4 for Illuminance Values). These recommendations provide a guide for efficient visual performance in office spaces rather than for safety alone. For a tabulation of minimum levels of illumination required for safety, see Table 7.

Reception area

For color matching, the quality of the color of the light source may be important.

6. Designing to higher levels to accommodate poor quality tasks should be undertaken only after it is determined that task quality cannot be improved. If a poor quality task cannot be eliminated, its "time-and-importance" factor should be carefully considered before allowing it to govern the illuminance level selection.

7. See Reference 9.

! Task subject to veiling reflections. Illuminance listed is not an ESI value. Currently, insufficient experience in the use of ESI target values precludes the direct use of Equivalent Sphere Illumination in the present consensus approach recommend illuminance values. Equivalent Sphere Illumination may be

2005 New weight of A 2011 A 20

NOTES:

* One store may encompass all three types within the building: High Activity area — where merchandise displayed has recognizable usage. Evaluation and viewing time is rapid, and merchandise is sown to attract and stimulate the impulse buying decision; Medium Activity — where merchandise is familiar in type or usage, but the customer may require time and/or help in evaluation of quality, usage, or for the decision to buy; and Low Activity — where merchandise is displayed that is purchased less frequently by the customer, who may be unfamiliar with the inherent quality, design, value or usage. Where assistance and time is necessary to reach a buying decision.

** Maintained on the task or in the area at any time.

*** Lighting levels to be maintained in the plane of the merchandise.

Fig. 2-1. Currently Recommended Illuminance Categories and Illuminance Values for Lighting Design --

Targeted Maintenance Levels. The tabulation that follows is a consolidated listing This table has been divided into the six parts for of the Society's current illuminance recommendations. ease of use. Part I provides a listing of both Illuminance This listing is intended to guide the lighting designer in Categories and Illuminance Values for generic types of selecting an appropriate illuminance for design and interior activities and normally is to be used when evaluation of lighting systems. Illuminance Categories for a specific Area/Activity cannot be found in parts II and III. Parts IV, V and VI Guidance is provided in two forms: (1), in Parts I, II provide target maintained Illuminance Values for and III as an Illuminance Category, representing a outdoor facilities sports and recreational areas, and range of illuminances (see page 2-3 for a method of transportation vehicles where special considerations selecting a value within each illuminance range); and apply as discussed on page 24. (2), in parts IV, V and VI as an Illuminance Value. Illuminance Values are given in lux with an approximate In all cases the recommendations in this table are equivalence in footcandles and as such are intended as based on the assumption that the lighting will be target (nominal) values with deviations expected. properly designed to take into account the visual These target values also represent maintained values characteristics of the task. See the design information (see page 2 23). in the particular application sections in this Application Handbook for further recommendations II. ¹Include provisions for higher levels for exhibitions.

²Specific limits are provided to minimize deterioration effects.

³Task subject to veiling reflections. Illuminance listed is not an Equivalent Sphere Illumination (ESI) value. Currently, insufficient experience in the use of ESI target values precludes the direct use of ESI in the present consensus approach to recommend illuminance values. ESI may be used as a tool in determining the effectiveness of controlling veiling reflections and as a part of the evaluation of lighting systems.

⁴Illuminance values are listed based on experience and consensus. Values relate to needs during various religious ceremonies.

⁵Degradation factors: Overlays -- add 2 weighting factor for each overlay; Used material -- estimate additional factors.

⁶Provide higher level over food service or selection areas.

²Supplementary illumination as in delivery room must be available.

8Illuminance values developed for various degrees of store area activity.

⁹Or not less than 1/5 the level in the adjacent areas.

Only when actual equipment service is in process. May be achieved by a general lighting system or by localized or portable equipment.

¹¹For color matching, the spectral quality of the color of the light source is important.

¹²Veiling reflections may be produced on glass surfaces. It may be necessary to treat plus weighting factors as minus in order to obtain proper illuminance.

¹³Especially subject to veiling reflections. It may be necessary to shield the task or to reorient it.

14Vertical

⁴⁵Illuminance values may vary widely, depending upon the effect desired, the decorative scheme, and the use made of the room.

Supplementary lighting should be provided in this space to produce the higher levels required for specific seeing tasks involved.

¹⁷Good to high color rendering capability should be considered in these areas. As lamps of higher luminous efficacy and higher color rendering capability become available and economically feasible, they should be applied in all areas of health care facilities.

¹⁸Variable (dimming or switching).

¹⁹Values based on a 25 percent reflectance, which is average for vegetation and typical outdoor surfaces. These figures must be adjusted to specific reflectances of materials lighted for equivalent brightness. Levels give satisfactory brightness patterns when viewed from dimly lighted terraces or interiors. When viewed from dark areas they may be reduced by at least 1/2; or they may be doubled when a high key is desired.

²⁰General lighting should not be less than 1/3 of visual task illuminance nor less than 200 lux [20] footcandles].

24Industry representatives have established a table of single illuminance values which, in their opinion, can be used in preference to employing reference 6. Illuminance values for specific operations can also be determined using illuminance categories of similar tasks and activities found in this table and the application of the appropriate weighting factors in Fig. 2-3.

²²Special lighting such that (1) the luminous area is large enough to cover the surface, which is being inspected and (2) the luminance is within the limits necessary to obtain comfortable contrast conditions. This involves the use of sources of large area and relatively low luminance in which the source luminance is the principal factor rather than the illuminance produced at a given point.

²³Maximum levels -- controlled system.

²⁴Additional lighting needs to be provided for maintenance only.

²⁵Color temperature of the light source is important for color matching.

²⁶ Select upper level for high speed conveyor systems. For grading redwood lumber 3000 lux [300 footcandles] is required.

²⁷Higher levels from local lighting may be required for manually operated cutting machines.

²⁸If color matching is critical, use illuminance category G.

* US Energy Policy Act of 1992 affect on lamps

Beginning in April 1994, many common wattage lamp types can no longer be manufactured or imported into the U.S. Federal Energy Legislation has decreed that these lamp types must be eliminated to reduce energy consumption. Lamp Types affected include the following fluorescent lamps:

Fluo	rescent Lamps	F40U/3	Cool White	F96T12/	₩

** US National Appliance Energy Conservation Act of 1988 affect on ballasts
In 1991 using the following Standard Magnetic ballasts was not permitted in the US.

-Single and two-lamp ballasts for 4' T12 Rapid Start Lamps, 120V & 277V 60Hz

-Two-lamp ballasts for 8' T-12 Slimline lamps

-Two-lamp ballasts for 8' T12 high-output rapid start lamps

Appendix NB - Illuminance Categories and Luminaire Power

ACM NC-2005

Appendix NC - Fan Motor Efficiencies¹

NOTE: THIS SECTION PREVIOUSLY CONTAINED WEATHER/CLIMATE DATA INFORMATION THAT IS CURRENTLY LOCATED IN JOINT APPENDIX II. THE FAN MOTOR EFFICIENCY TABLES THAT APPEAR BELOW WERE FORMALLY LOCATED APPENDIX B IN THE 2001 NACM.

Table NC-1 Fan Motor Efficiencies (< 1 HP)

Nameplate or Brake Horsepower	Standard Fan Motor Efficiency	NEMA* High Efficiency	Premium Efficiency
1/20	<u>40%</u>	<u></u>	<u></u>
1/12	<u>49%</u>	<u></u>	<u></u>
<u>1/8</u>	<u>55%</u>	<u></u>	<u></u>
<u>1/6</u>	<u>60%</u>	<u></u>	<u></u>
1/4	<u>64%</u>	<u></u>	<u></u>
<u>1/3</u>	<u>66%</u>	<u></u>	<u></u>
<u>1/2</u>	<u>70%</u>	<u>76.0%</u>	80.0%
<u>3/4</u>	<u>72%</u>	<u>77.0%</u>	<u>84.0%</u>

NOTE: For default drive efficiencies, See Section 4.2.2

*NEMA - Proposed standard using test procedures.

Minimum NEMA efficiency per test IEEE 112b Rating Method.

Reference Weather/Climate Data

Appendix C: Reference Weather/Climate Data

C.1 Weather Data - General

All energy budget calculations for compliance runs use a form of the weather data in the Commission's official sixteen (16) climate zone hourly weather files. The reference method uses a form of this data that is adjusted for local ASHRAE design data extremes. These files are available from the Commission in the WYEC2 (Weather Year for Energy Calculations) format recognized by ASHRAE and in DOE 2.1E packed weather data format. The reference method computer program for adjusting the climate zone weather data for local ASHRAE design data is also available from the Commission. Temperatures in the WYEC2 files for the sixteen climate zones have been adjusted to the average means and extremes of the weather data of the reliable substations in each climate zone. See Climate Zone Weather Data Analysis and Revision Project, Final Consultant Report, CEC Publication # P400-92-004, for more detail.

The WYEC2 data may be adjusted for local conditions, condensed, statistically summarized or otherwise reduced, as long as:

a)The weather data used to derive the simplified or reduced data is the Commission's official hourly weather data; and,

b)The ACM program meets all of the certification tests using the reduced weather data.

Whatever weather data and/or weather data reduction methods are used, approval of the ACM for compliance purposes with the standards is contingent upon the fact that approved weather data will be used for all compliance runs. The Commission must be able to verify that the proper weather data is being used by building permit applicants.

The official weather data for energy compliance is available from the Commission in a form suitable for 3.5" high density IBM PC-formatted diskettes. There are 16 climate zones, each with an 8760 hourly records containing raw data on a variety of ambient conditions such as:

□Dry bulb temperature
□Wet bulb temperature
⊟Wind speed and direction
□Direct solar radiation
□Diffuse radiation

Each climate zone file includes the non-temperature data of a particular city whose annual climate data has been judged representative of the construction locations within that zone. The values listed by climate zone and the nominal city location for each climate zone in Table C-1 in this section, Section C.1,

must be used for any given climate zone if the ACM does not automatically make local city weather adjustments to the files.

As indicated above the reference method uses local city ASHRAE design data to adjust the climate zone weather data. These adjustments customize the temperature data, especially the extremes, to conform to the ASHRAE design data statistics for the city in question. This makes the HVAC sizing and energy calculations more realistic for energy compliance simulations.

Table C-1: California Climate Zone Summary

Climat	e			
Zone	City	Latitude	Longitude	Elevation
1	Arcata	40.8	124.2	43
2	Santa Rosa	38.4	122.7	164
3	Oakland	37.7	122.2	6
4	Sunnyvale	37.4	122.4	97
5	Santa Maria	34.9	120.4	236
6	Los Angeles AP	33.9	118.5	97

11	Red Bluff	40.2	122.2	342
12	Sacramento	38.5	121.5	17
13	Fresno	36.8	119.7	328
14	China Lake	35.7	117.7	2293
15	El Centro	32.8	115.6	30
16	Mt. Shasta	41.3	122.3	3544

C.2 WYEC2 Climate/Weather Data Format

The ASCII versions of the WYEC2 weather files consist of 8760 identical fixed format records, one for each hour of a 365 day year. Each record is 116 characters in length and is organized according to the format shown in Table C-2 which follows.

The WYEC2 format is derived from the NOAA TD-9734 Typical Metteorological Year (TMY) format in that WYEC2 uses the same field encoding and units as TMY. However, it should be noted that **all WYEC2 values are for Local Standard Time.** That is, WYEC2 data should be read sequentially and used with no conversion (except any required unit conversions). This is in marked contrast to the TMY files which contain solar data for Apparent Solar Time and meteorological data for Local Standard Time.

Irradiance and illuminance fields contain data integrated over the hour, meteorological fields contain observations made at the end of the hour. For example, hour 12 contains irradiance/illuminance integrated from 11-12 and meteorological observations made at 12.

Table C-2 WYEC DATA FORMAT

TABLE C-2 WYEC2 DATA FORMAT

Field Number	Data Positions	Flag Position (see notes)	-Data Element and Description
-001	001-005	_	-WBAN station identification number
			Unique number to identify each station
			-California compliance files contain 00001 00016 in this field to indicate the -climate zone

-002	006-006	_	File source code
			— W = WYEC
			— <u>T = TMY</u>
			— C = California Compliance
-003	007-014	_	Time, Yr Mo Day Hr (2 chars each)
			Yr omits the "19" and indicates the source year for the data, i.e., 00 = 1900, 99 = 1999. Data within a single WYEC2 file may have been observed in more than one year.
			-Mo is 1 to 12.
			Day is 1 to month length (28, 30, or 31).
			Hr is 1 to 24.
-101	015-018		Extraterrestrial irradiance, kJ/m ²
			Amount of solar energy received at top of atmosphere during solar hour ending—at time indicated in field 003, based on solar constant of 1367 kJ/m ² .
			-Nightime values are shown as 0.
-102	019-022	023-024	-Global horizontal irradiance, kJ/m ²
			Total of direct and diffuse radiant energy received on a horizontal surface by a pyranometer during the hour ending at the time indicated in field 003.
-103	025-028	029 030	-Direct normal irradiance, kJ/m ²
			Portion of the radiant energy received at the pyrheliometer directly from the sun during the hour ending at the time indicated in field 003.
-104	031-034	035-036	-Diffuse horizontal irradiance, kJ/m ²
			Amount of radiant energy in kJ/m2 received at the instrument indirectly from the sky during the hour ending at the time indicated in field 003.

-105	037-040	041	-Global horizontal illuminance, lux * 100
-106	042 045	046	Direct normal illuminance, lux * 100
-107	047-050	051	Diffuse horizontal illuminance, lux * 100
-108	052-055	056	Zenith luminance, Cd/m ² * 100
-110	057-058	059	-Minutes of sunshine, 0 60 minutes
-201	060-063	064	Ceiling Height, m * 10
			-Ceiling is defined as opaque sky cover of 0.6 or greater.
			— 0000 — 3000 = 0 to 30,000 m
			— 7777 = unlimited; clear
			— 8888 = unknown height of cirroform ceiling
-202	065-068	069	Sky Condition
			All observations assumed to be made after 1 June 1951. ("indicator" at position 77 in TMY is omitted).
			Coded by layer in acending order; four layers are described; if less
			than 4 layers are present the remaining positions are coded 0. The
			code for each layer is:
			0 = Clear of less than 0.1 cover
			1 = Thin scattered (0.1 0.5 cover)
			2 = Opaque scattered (0.1 - 0.5 cover)
			<u>3 = Thin broken (0.6 - 0.9 cover)</u>
			l l

			-4 = Opaque broken (0.6 - 0.9 cover)
			-5 = Thin overcast (1.0 cover)
			-6 = Opaque overcast (1.0 cover)
			7 = Obscuration
			8 = Partial obscuration
203	070 073	074	Visibility, m * 100
			Prevailing horizontal visibility.
			— 0000 1600 = 0 to 160 kilometers
			8888 = unlimited
-204	-075-082	083	-Weather
			Eight single digit codes as follows:
-204	-075		-Occurrence of thunderstorm, tornado or squall.
(cont.)			-0 = None
			1 = Thunderstorm lightning and thunder. Wind gusts less than 50 knots, and hail, if any, less than 3/4 inch diameter.
			2 = Heavy or severe thunderstorm—frequent intense lightning and
			thunder.Wind gusts 50 knots or greater and hail, if any, 3/4 inch or greater diameter.
			-3 = Report of tornado or waterspout.
			-4 = Squall (sudden increase of wind speed by at least 16 knots, reach 22 knots or more and lasting for at least one

		1	п
			minute).
-204	-076		Occurrence of rain, rain showers or freezing rain:
(cont.)			
			_0 = None
			-1 = Light rain
			-1 Eight iam
			−2 = Moderate rain
			3 = Heavy rain
			-4 = Light rain showers
			5
			_5 = Moderate rain showers
			3 - Moderate rain showers
			-6 = Heavy rain showers
			-7 - Light freezing rain
			-8 = Moderate or heavy freezing rain
-204	-077		Occurrence of drizzle, freezing drizzle
	'077		Occurrence of urizzie, recezing urizzie
(cont.)			
			−0 = None
			-1 = Light drizzle
			2 – Moderate drizzle
			- Modelino dilegio
			−3 = Heavy drizzle

	l	l	
			-4 = Light freezing drizzle
			-5 = Moderate freezing drizzle
			6 = Heavy freezing drizzle
204	-078		-Occurrence of snow, snow pellets or ice crystals
(cont.)			-0 = None
			1 = Light snow
			-2 = Moderate snow
			-3 - Heavy snow
			-4 = Light snow pellets
			_5 = Moderate snow pellets
			-6 = Heavy snow pellets
			-7 = Light ice crystals
			-8 = Moderate ice crystals
			Beginning April 1963 intensities of ice crystals were discontinued.
			-All occurrences since this date are recorded as an 8.
-204 (cont.)	-079		-Occurence of snow showers or snow grains
(cont.)			-0 = None
			-1 = Light snow showers
			-2 = Moderate snow showers
			"

		-3 = Heavy snow showers
		-4 = Light snow grains
		_5 = Moderate snow grains
		6 = Heavy snow grains
		Beginning April 1963 intensities of snow grains were discontinued.
		-All occurrences since this date are recorded as a 5.
-204 (cont.)	-080	-Occurence of sleet (ice pellets), sleet showers or hail
(cont.)		− 0 = None
		1 = Light sleet or sleet showers (ice pellets)
		-2 = Moderate sleet or sleet showers (ice pellets)
		-3 = Heavy sleet or sleet showers (ice pellets)
		-4 = Light hail
		−5 = Moderate hail
		-6 = Heavy hail
		-7 = Light small hail
		-8 = Moderate or heavy small hail
		Prior to April 1970 ice pellets were coded as sleet. Beginning April 1970 sleet and small hail were redefined as ice pellets and are coded as a 1, 2, or 3 in this position. Beginning September 1956 intensities of hail were no longer reported and all occurrences were recorded as a 5.

204	-081	Occurrence of fog, blowing dust or blowing sand
(cont.)		-0 = None
		1 = Fog
		-2 = Ice Fog
		-3 = Ground Fog
		4 = Blowing dust
		-5 - Blowing sand
		These values recorded only when visibility less than 7 miles.
-204	-082	Occurrence of smoke, haze, dust, blowing snow or blowing spray:
(cont.)		− 0 = None
		−1 = Smoke
		-2 - Haze
		-3 = Smoke and haze
		-4 = Dust
		−5 = Blowing snow
		-6 = Blowing spray
		These values recorded only when visibility less than 7 miles.

	1	1	<u> </u>
-205	-084-088	-089	-Station pressure, kilopascals (kPa) * 100
			Pressure at station level
			- 08000 10999 = 80 to 109.99 kPa.
-206	-090-093	-094	-Dry bulb temperature, °C * 10
			$-700 \text{ to } 0600 = 70.0 \text{ to } +60.0^{\circ}\text{C}$
-207	-095-098	-099	-Dew point, ^o C * 10
			$-700 \text{ to } 0600 = 70.0 \text{ to } +60.0^{\circ}\text{C}$
-208	-100-102	-103	-Wind direction, 0 - 359 degrees
			-0 = north
			Note TMY range is 0-360, WYEC2 has recoded 360 as 0.
-209	-104-107	-108	-Wind speed, m/s * 10
			<u> 0 - 1500 = 0 to 150.0 m/s.</u>
			-Wind speed and wind direction both 0 indicates calm.
210	-109-110	-111	Total Sky Cover, 0 - 10 in tenths
			Amount of celestial dome in tenths covered by clouds or obscuring phenomena.
211	-112-113	-114	-Opaque Sky Cover, 0 10 in tenths
			Amount of celestial dome in tenths covered by clouds or obscuration through
			-which the sky and/or higher cloud layers cannot be seen.
-212	-115-115	-116	Snow Cover
			—0 = no snow or a trace of snow
			—1 = indicates more than a trace of snow on the ground

Notes for Table C-2 - WYEC2 Format:

Field -

- 1.Total file size (including CRLFs) = 118 x 8,760 = 1,033,680 characters.
- 2.Flag characters indicate the source of the associated value and, in the case of solar fields, optionally give information about the quality of the value.

Some fields have no flag, others have 1 or 2 character flags as follows:

Flag type / comment

	001 003	None (record identification fields)
	101	None (calculated extraterrestrial irradiance is always present)
	102 1042	- character (irradiance values)
	105 2121	character (all remaining fields)
One charac	eter flags are al _l	chabetic (with the exception of 9 for missing) and are defined as follows:
	(blank)	Value was observed (that is, not derived with a model and not altered.)
	<u>A</u>	Value has been algorithmically adjusted (e.g., dry bulb temperatures were shifted to match long term means).
	E	Value was missing and has been replaced by a hand estimate.

Value was bad and has been replaced by a hand estimate.

fromneighboring observations.

neighboring observations.

Value was missing and has been replaced with one derived by interpolation

Value was bad and has been replaced with one derived by interpolation from

<u>4</u> —	1 Value	was missing and has been replaced with one derived with a model (modelused depends on element).
4 -	Value usedd	e was bad and has been replaced with one derived with a model (model lepends on element).
F	Value	e violated a physical limit and has been replaced by that limit.
-	Value	e is derived from other values (e.g., illuminance data which were not observed).
9	Value	e is missing; data positions contain 9s as well.
Two characte	flags (on irradiance fic	elds 102, 103, and 104) are either:
4	. 1 chara	eter flag (as defined above) followed by a blank, or
4		cter numeric value in the range 00 to 99 and are defined in SERI Standard rmat 2, as follows:
	1 03 Element passe	d tests on physical limits, model limits (for tolerances less than
-		ent passed hand/eye tests.
0	5 Eleme	ent failed hand/eye tests and has not been corrected.
0	6 Elem e	ent was missing and has not been replaced with an estimate.
e	7 Eleme	ent's value is lower than a physical limit.
0	8 Eleme	ent's value is higher than a physical limit.
0		ent's value is inconsistent with other components (e.g. direct not consistent with global)
	93 Element excee types are defin	ded the 3% tolerance in one of four ways. The following error

0 = too low by 3 parameter coupling

1 = too high by 3 parameter coupling

2 - too low by 2D boundary comparison

3 = too high by 2D boundary caparison

The flags in this range are constructed in such a way that both the percentage of error and the type of error are encoded in the two digit flag. To create the flag, one multiplies the percentage of disagreement by 4, subtract 2, and add the error type. The percentage of error should be truncated - only the integer part is used.

The particular error is determined by the remainder of MOD(IQC=2 / 4), where "MOD0 is a mathematical function representing the remainder of the quantity (IQC+2)/4 and "IQC" is the two digit flag number. The percentage error is determined by

$$\frac{IPCT = Int((IQC + 2)/4)}{IPCT}$$

IPCT = 23 indicates an error greater than 23%.

$$94.97 KN = KT + ERR$$

FLAG ERR

94 5% ETR <= ERR <10% ETR

95 10% ETR <= ERR <15% ETR

96 15% ETR <= ERR < 20% ETR

97 20% ETR <= ERR

99 Element is missing or null.

It should be noted that the 2 character numeric flags are appropriate for encoding the results of quality control processing of archival solar data. The 1 character alphabetic flags are appropriate for "best estimate" data sets in which any questionable values have been replaced. most WYEC2 files used for engineering purposes will fall into the latter category and will thus use the alphabetic flags on solar fields.

- 3. Missing elements are 9 filled: all data and flag positions contain 9s.
- 4. Conversion factors relevant to WYEC2 use:

To convert from	to	multiply by
kj/m2	Btu/ft2	0.08807
m/s * 10	mph	0.2273
kPai	n. Hg.	0.002953
m * 10	ft	32.808
m * 100 miles	miles	0.06214

C.3 Climate/Weather Data Adjustments for Local Conditions

This appendix section describes the official procedure used by the California Energy Commission to adjust the Title 24 climate zone data for the sixteen (16) climate zones to match the ASHRAE design day conditions for a specific city. Computer software available from the California Energy Commission takes weather data from one of the sixteen climate zones and uses ASHRAE design data for a specific city within that climate zone to create weather data in the format required by the DOE 2 building simulation program. The generated weather data has the latitude, longitude, elevation and air properties of a particular city instead of the climate zone's designated weather station indicated in Table D-3. This procedure only modifies the weather data on the climate zone data file to match a city's design conditions for the days which fall within the ASHRAE summer and winter design day percentage levels. However, the entire data set is adjusted to reflect the city's elevation. This city specific data into DOE-2 allows the program's Heating Ventilation and Air Conditioning (HVAC) sizing procedures to use design conditions closer to the simulated building's actual location. This section outlines the procedure used to incorporate a city's design day data into an hourly climate zone data set.

BACKGROUND

The California Energy Commission, in developing and implementing the Title 24 building energy efficiency standards, has defined sixteen zones that encompass the diversity of California's climatic regions. Each climate zone's hourly weather data set has been derived, predominantly, from a single weather station. Past work sponsored by the Commission modified these data sets to reflect the weather conditions of specific geographic areas within certain climate zones where high levels of building construction were anticipated. This modified Title 24 climate zone data, however, does not represent the particular climatic conditions of any individual city or a specific building site but rather the climate zone as a whole. The weather adjustments described below are intended to increase a compliance program's ability to properly size and simulate HVAC systems.

DEFINITIONS

CITY One of the California cities listed in ASHRAE's CLIMATIC DATA FOR REGION X

TAPE Hourly data which describes the regional weather patterns for one of the 16 California mate zones

RH Relative Humidity (%)

DB	Dry Bulb temperature (^e F)
WB	- Wet Bulb temperature (°F)
P	Pressure (psia)
MIN	- Minimum Daily Dry Bulb Temperature (°F)
MAX Maximu	m Daily Dry Bulb Temperature (°F)
AVG	Average Daily Dry Bulb Temperature (°F)
	=MAX - MIN) / 2
RANGE	Daily Dry Bulb Temperature Range (°F)
	= (MAX - MIN)
RH RATIO	The Daily Ratio of RH _{MAX} for the CITY to RH _{MAX} for the TAPE
ODR	Outdoor Daily Range (°F) as defined by ASHRAE: the difference between the average maximum and average minimum temperature for the warmest month
F	An hourly temperature function derived from the TAPE
	-= (DB_{HR}AVG) / RANGE

METHODOLOGY

First, the climate zone design conditions as specified by ASHRAE are computed from the TAPE. The maximum DB is also found off the TAPE. The CITY maximum DB is computed as:

The psychrometric equations are used to derive RH for the TAPE design conditions³. The atmospheric pressure is adjusted for the CITY elevation, then RH is computed for the CITY design conditions. The form of equation [1] is used to derive the CITY maximum RH, using the TAPE maximum RH and the RH values computed for the TAPE and the CITY at the 0.1% DB conditions.

For each day of the year the following steps are completed:

- 1.MAX, Min, AVG, RAGE, WB_{MAX} and RH_{MAX} are determined for the TAPE,
- 2.A mapping procedure, delineated in Figure 1, is used to find RH_{MAX}. for the CITY from the CITY RH design values, the TAPE DB design values and MAX for the TAPE,
- 3.RH_{MAX} and RH RATIO are determined for the CITY. The RH RATIO is set to 1 for all days with MAX less than the CITY 2.0% maximum DB, which equates the RH of the CITY to the RH of the TAPE for all non-design days,
- 4.MAX and MIN for the CITY are computed using mapping procedures similar to that illustrated in Figure 1, from the CITY DB design conditions, the TAPE DB design conditions and MAX/MIN for the TAPE.
- 5.MAX and MIN for the CITY are corrected for the CITY elevation⁴,
- 6.RANGE is calculated for the CITY. RANGE is adjusted by the ratio of the ODR for the CITY to the ODR of the TAPE if MAX is greater then the CITY 2.0% maximum DB,

7.AVG for the CITY is calculated in one of three ways:

(a) AVG = MAX -5.0* RANGE,

if MAX > CITY 2.0% maximum DB, or

(b) AVG = MIN + 0.5* RANGE,

if MIN < CITY 0.6% minimum DB, or

(c) AVG = (MAX + MIN) / 2.

Once the daily CITY statistics are computed, they can be applied to the hourly TAPE to generate an hourly CITY weather data set. For each hour of the year, the following steps are completed.

- 1.F is calculated from the Tape.
- 2.P is corrected for CITY elevation,
- 3.RH is calculated for the TAPE,
- 4.RH for the CITY is derived by applying the RH RATIO to the RH for the TAPE,
- 5.DB for the CITY is computed: DB = AVG + F * RANGE,

6.WB is calculated using the new values for RH, DB and P for the CITY.

Upon completion of all weather adjustments the resulting data set is converted to the binary format required by the DOE-2 simulation program.

RESULTS

An example of the hourly weather adjustments from a TAPE to a CITY is displayed in figure 2. Four summer days are extracted from both the cimate zone 16 data (Mt. Shasta) and the city-specific data (Tahoe City). The first day plotted falls below the design day threshold; the next three days plotted are design days. The figure depicts the expected downshift of hourly temperatures from Mt. Shasta (maximum DB = 96° F) to Tahoe City (maximum DB = 87° F).

SOFTWARE PACKAGE

To obtain the software used to adjust DOE 2 files to local design conditions for 641 California cities that is described in this section of Appedix D write to:

LOCAL WEATHER SOFTWARE
EFFICIENCY TECHNOLOGY OFFICE
CALIFORNIA ENERGY COMMISSION
1516 NINTH ST., MS-42
SACRAMENTO, CA 95814-5512

You must include a self-addressed, stamped diskette mailer and a preformatted 1.4

NOTES for SECTION C.3

1. ASHRAE Publication SPCDX, CLIMATIC DATA FOR REGION X: ARIZONA, CALIFORNIA, HAWAII, NEVADA, defines a city's design day conditions as the ambient dry bulb and wet bulb temperatures which are percentage levels of hours on an annual basis: Summer values are presented for the 0.1%, 0.5% and 2.0% of the annual maximum dry bulb temperature; Winter values are presented for the median, the 0.2% and 0.6% of the annual minimum dry bulb temperature. This publication lists design day data for 641 California cities.

- 2. The computer software described herein produces two output files. The first file is the hourly weather data in binary DOE-2 format. To produce this file staff has incorporated a program created by Jeff Hirsch (James J. Hirsch and Associates) which converts an ASCII data file into the packed DOE-2 file format. This file is compatible with the DOE-2 program compiled and distributed by James J. Hirsch and Associates as well as several other PC versions of DOE-2. The second file produced is an ASCII file that contains building location data as well as specific design data required by the CEC's nonresidential Alternative Calculation Method (ACM) procedures.
- 3. The mathematical equations which describe the thermodynamic properties of moist air are published in the ASHRAE HANDBOOK FUNDAMENTALS Volume, PSYCHROMETRICS Chapter. The relative humidity (RH) which corresponds to specific dry bulb and wet bulb temperatures is derived by these principles of psychrometrics throughout this weather adjustment procedure.
- Elevation adjustments to dry bulb temperature and pressure are made using the standard atmospheric data published in the ASHRAE FUNDAMENTALS Volume, PSYCHROMETRIC Chapter.

C.4 California City Design Weather Data

The data contained in the multi-page Table C-3 was obtained through a joint effort by the Southern California Chapter and the Golden Gate Chapter of ASHRAE. It is reprinted here with the expressed written permission of Southern California Chapter ASHRAE, Inc.

A full listing of design weather data for California cities is contained in the ASHRAE publication *SPCDX*, *Climatic Data for Region X: Arizona*, *California*, *Hawaii*, *Nevada* (May, 1982). The publication may be ordered from:

^{*}Heating Degree Day is a unit, based on temperature difference and time, used in estimating fuel consumption and specifying nominal annual heating load of a building. For any one day when the mean temperature is less than 65°F (18°C), there exist as many degree days as there are Fahrenheit degrees difference in temperature between mean temperature for the day and 65°F (18°C).

ACM ND-2005

Appendix ND - Compliance Procedures for Relocatable Public School Buildings

NOTE: THIS SECTION PREVIOUSLY CONTAINED GLOSSARY INFORMATION THAT IS CURRENTLY LOCATED IN JOINT APPENDIX I. THE APPENDIX INFORMATION BELOW IS ENTIRELY NEW FOR THE 2005 ACM MANUAL.

ND.1 Purpose and Scope

This document describes the compliance procedures that shall be followed when the whole building performance approach is used for relocatable public school buildings. Relocatable public school buildings are constructed (manufactured) at a central location and could be shipped and installed in any California climate zone. Furthermore, once they arrive at the school site, they could be positioned so that the windows face in any direction. The portable nature of relocatable classrooms requires that a special procedure be followed for showing compliance when the whole building performance method is used. Compliance documentation for relocatable public school buildings will be reviewed by the Division of the State Architect.

ND.2 The Plan Check Process

The Division of the State Architect (DSA) is the building department for relocatable public school buildings. Since relocatables are manufactured in batches, like cars or other manufactured products, the plan check and approval process occurs in two phases. The first phase is when the relocatable manufacturer completes design of a model or modifies a model. At this point, complete plans and specifications are submitted to the DSA; DSA reviews the plans for compliance with the energy standards and other California Building Code (CBC) requirements; and a "pre-check" (PC) design approval is granted. Once the PC design is approved, a school district or the manufacturer may file an "over-the-counter" application with DSA to construct one or more relocatables. The over-the-counter application is intended to be reviewed quickly, since the PC design has already been pre-checked. The over-the-counter application is the building permit application for construction and installation of a relocatable at a specific site, and includes the approved PC design drawings as well as site development plans for the proposed site where the relocatable will be installed. An over-the-counter application also is required for the construction of a stockpile of one or more relocatables based on the approved PC design drawings. Stockpiled relocatables are stored typically at the manufacturer's yard until the actual school site is determined where the relocatable will be installed. Another over-the-counter application is required to install a previously stockpiled relocatable at which time site development plans for the proposed site are checked.

The effective date for all buildings subject to the energy standards is the date of permit application. If a building permit application is submitted on or after the effective date, then the new energy standards apply. For relocatable classrooms, the date of the permit application is the date of the over-the-counter application, not the date of the application for PC design approval. The PC design is only valid until the code changes.

ND.3 The Compliance Process

<u>Like other nonresidential buildings, the standard design for relocatable public school buildings is defined by the prescriptive requirements. In the case of relocatables, there are two choices of prescriptive criteria:</u>

- Table 143-C in the Standards may be used for relocatable school buildings that can be installed in any climate zone in the state. In this case, the compliance is demonstrated in climates 14, 15, and 16 and this is accepted as evidence that the classroom will comply in all climate zones. These relocatables will have a permanent label that allows it to be used anywhere in the state.
- Table 143-A in the Standards may be used for relocatable school buildings that are to be installed in only specific climate zones. In this case, compliance is demonstrated in each climate zone for which the relocatable has been designed to comply. These relocatables will have a permanent label that identifies in which climate zones it may be installed. It is not lawful to install the relocatable in other climate zones.

The building envelope of the standard design has the same geometry as the proposed design, including window area and position of windows on the exterior walls, and meets the prescriptive requirements specified in §143. Lighting power for the standard design meets the prescriptive requirements specified in §146. The HVAC system for the standard design meets the prescriptive requirements specified in §144. The system typically installed in relocatables is a single-zone packaged heat pump or furnace. Most relocatable school buildings do not have water heating systems, so this component is neutral in the analysis. Other modeling assumptions such as equipment loads, are the same for both the proposed design and the standard design and are specified in the Nonresidential ACM Manual.

Manufacturers shall certify compliance with the standards and all compliance documentation shall be provided. If the manufacturer chooses to comply using Table 143-A for compliance in only specific climate zones, then the manufacturers shall indicate the climates zones for which the classroom will be allowed to be located.

Since relocatable public school buildings could be positioned in any orientation, it is necessary to perform compliance calculations for multiple orientations. Each model with the same proposed design energy features shall be rotated through 12 different orientations either in climate zones 14, 15 and 16 for relocatables showing statewide compliance or in the specific climate zones that the manufacturer proposes for the relocatable to be allowed to be installed, i.e., the building with the same proposed design energy features is rotated in 30 degree increments and shall comply in each case. Approved compliance programs shall automate the rotation of the building and reporting of the compliance results to insure it is done correctly and uniformly and to avoid unnecessary documentation.

ND.4 Documentation

The program shall present the results of the compliance calculations in a format similar to Table ND-1. For each of the cases (12 orientations times number of climates), the Time Dependent Valuation (TDV) energy for the Standard Design and the Proposed Design are shown (the energy features of the *Proposed Design* shall be the same for all orientations). The final column shows the compliance margin, which is the difference between the TDV energy for the *Proposed Design* and the Standard Design. Approved compliance programs shall scan the data presented in the Table ND-1 format and prominently highlight the case that has the smallest compliance margin. Complete compliance documentation shall be submitted for the building and energy features that achieve compliance in all of the climate zones and orientations as represented by the case with the smallest margin. DSA may require that compliance documentation for other cases also be submitted; showing that the *Proposed Design* building and energy features are identical to the case submitted, in each orientation and climate zone. Table ND-1 shows rows for climate zones 14, 15, and 16, which are the ones used when the criteria of Table 143-C is used to show compliance throughout the state. If the criteria of Table 143-A is used, then rows shall be added to the table for each climate zone for which the manufacturer wants the relocatable to be allowed to be installed.

ND.5 Optional Features

Relocatable classrooms may come with a variety of optional features, like cars. A school district can buy the "basic model" or it can pay for options. Many of the optional features do not affect energy efficiency and are not significant from the perspective of energy code compliance. Examples include floor finishes (various grades of carpet or tiles), casework, and ceiling and wall finishes. Other optional features do affect energy performance such as window construction,

insulation, lighting systems, lighting controls, HVAC ductwork, HVAC equipment, and HVAC controls.

When a manufacturer offers a relocatable classroom model with a variety of options, it is necessary to identify those options that affect energy performance and to show that the model complies with any combination of the optional features. Most of the time, optional energy features are upgrades that clearly improve performance. If the basic model complies with the Standards, then adding any or all of the optional features would improve performance. The following are examples of optional features that are clear upgrades in terms of energy performance:

- HVAC equipment that has both a higher SEER and higher EER than the equipment in the basic model.
- Lighting systems that result in less power than the basic model.
- Lighting controls, such as occupancy sensors, that are recognized by the standards and for which power adjustment factors in Table 146-B are published in §146 of the Standards.
- Windows that have both a lower SHGC and lower U-factor (limited to relocatables that do not take credit for daylighting).
- Wall, roof or floor construction options that result in a lower U-factor than the basic model.

For energy code compliance purposes, it is necessary to show that every variation of the relocatable classroom that is offered to customers will comply with the Standards. There are two approaches for achieving this, as defined below:

1) Basic Model Plus Energy Upgrades Approach The simplest approach is to show that the basic model complies with the Standards and that all of the options that are offered to customers are clear energy upgrades that would only improve performance. As long as each and every measure in the basic model is met or exceeded by the energy upgrades, the relocatable classroom will comply with the standards.

While clear upgrades are obvious in most cases, the following are some examples of options that are not energy upgrades, for which additional analysis would be needed to show compliance that every combination of options comply.

- HVAC equipment that has a higher SEER, but a lower EER.
- Windows that lower SHGC but increase U-factor, or vice versa.
- Insulation options that reduce the U-factor for say walls, but increase it for the roof.
- Any other combination of measures that results in the performance of anyone measure being reduced in comparison to a complying basic model.
- 2) Modeling of Every Combination Approach. A more complex whole building performance approach is required when a model is available with options which in combination may or may not comply. In this case every combination of options shall be modeled, and the specific combinations that comply shall be determined and only those combinations shall be allowed. This approach, while possible, requires considerably more effort on the part of the relocatable manufacturer and its energy consultant. It also places a greater burden on DSA when they issue the over-the-counter building permit for the PC design that only allows specific combinations of energy options. DSA would have to examine the specific optional features that are proposed with the over-the-counter application and make sure that the proposed combination of measures achieves compliance.

The manufacturer or its energy consultant would need to prepare a table or chart that shows all of the acceptable combinations that achieve compliance. This chart could be quite complex, depending on the number of optional features that are offered.

<u>Table ND-2</u> is intended to illustrate the complexity that could be involved in modeling of every combination of energy features. It shows a list of typical optional features that would affect

energy performance. In this example, there are two possible for each of the eight options, e.g the feature is either there or not (in an actual case there could be a different number of options and a different number of states for any option). In the example any one of the features could be combined with any of the others. The number of possible combinations in this example is two (the number of states) to the eighth power (the number of measures that have two states). The number of possible options is then 2⁸ or 256. This is the number of combinations that would need to be modeled in order to determine which combinations of optional features achieves compliance.

<u>Table ND-2 – Examples of Optional Features for Relocatable Classrooms</u>

	Options Offered	<u>States</u>
1	Efficient lighting option	Yes/N
		<u>0</u>
2	High efficiency heat pump	Yes/N
		0
<u>3</u>	Improved wall insulation	Yes/N
		0
<u>4</u>	Improved roof insulation	Yes/N
		<u>0</u>
<u>5</u>	Occupancy sensor for	Yes/N
	lighting	<u>0</u>
<u>6</u>	Low-e windows	Yes/N
		0
<u>7</u>	<u>Skylights</u>	Yes/N
		<u>0</u>
8	Daylighting Controls	Yes/N
		0

2005 Nonresidential ACM Manual, Express Terms, 45-Day Language	Page ND-6

Appendix D:

Glossary

Appendix D: Definitions

Terms, phrases, words, and their derivatives in Part 6 of the California State Building Code shall be defined as specified in Section 101 of that Code. Terms, phrases, words, and their derivatives not found in Section 101 shall be defined as specified in Title 24, Part 2, Chapter 2 4 of the California Code of Regulations. Terms, phrases, words, and their derivatives not found in either Title 24, Part 6 or Chapter 2-4 shall be defined as specified in Part II, Chapter 4 of the Uniform Building Code. Where terms, phrases, words, and their derivatives are not defined in any of the references above, they shall be defined as specified in Webster's Third New International Dictionary of the English Language, Unabridged (1987 ed.), unless the context requires otherwise.

ACCA is the Air Conditioning Contractors of America.

ACCESSIBLE is having access thereto, but which first may require removal or opening of access panels, doors, or similar obstructions.

ADDITION is any change to a building that increases conditioned floor area and conditioned volume.

AIR-TO-AIR HEAT EXCHANGER is a device which will reduce the heat losses or gains which occur when a building is mechanically ventilated, by transferring heat between the conditioned air being exhausted and the unconditioned air being supplied.

ALTERATION is any change to a building's water heating system, space conditioning system, lighting system, or envelope that is not an addition. ALTERNATIVE CALCULATION METHODS (ACMs) are the Commission's Public Domain Computer Programs, one of the Commission's Simplified Calculation Methods, or any other calculation method approved by the Commission.

ALTERNATIVE CALCULATION METHOD (ACM) is a calculation method used to determine compliance with the building energy efficiency standards other than the reference method which (for the nonresidential building standards) uses the reference computer program, DOE 2.1E, as the computational engine. The current requirements limit ACMs to computer programs since there are specific requirements in this manual for required inputs, automated restrictive outputs, and automatic default assumptions.

ANNUAL FUEL UTILIZATION EFFICIENCY (AFUE) is a measure of the percentage of heat from the combustion of gas or oil which is transferred to the space being heated during a year, as determined using the applicable test method in the Appliance Efficiency Regulations or Section 112.

ANNUNCIATED is a visual signaling device that indicates the on, off, or other status of a load.

ANSI is the American National Standards Institute.

APPLIANCE EFFICIENCY REGULATIONS are the regulations in Title 20, Sections 1601 et. seq. of the California Code of Regulations.

APPROVED BY THE COMMISSION means approval under Section 25402.1 of the Public Resources Code.

APPROVED CALCULATION METHOD (See ALTERNATIVE CALCULATION METHODS).

ARI is the Air conditioning and Refrigeration Institute.

ASHRAE is the American Society of Heating, Refrigerating, and Air-conditioning Engineers.

ASME is the American Society of Mechanical Engineers.

ASTM is the American Society for Testing and Materials.

ATRIUM is an opening through two or more floor levels other than enclosed stairways, elevators, hoistways, escalators, plumbing, electrical, air conditioning, or other equipment which is enclosed space and not defined as a mall.

ATTIC is an enclosed unconditioned space directly below the roof and above the ceiling.

AUTOMATIC is capable of operating without human intervention.

AUTOMATIC TIME SWITCH CONTROL DEVICES are devices capable of automatically turning loads off and on based on time schedules.

BELOW GRADE WALL is the portion of a wall, enclosing conditioned space, that is below the grade line.

BUILDING is any structure or space for which a permit is sought.

BUILDING ENVELOPE is the ensemble of exterior and demising partitions of a building that enclose conditioned space.

CAPTIVE-KEY OVERRIDE is a type of lighting control in which the key that activates the override cannot be released when the lights are in the on position.

CEHLING is the interior upper surface of a space separating it from the attic, which has a slope less than 60 degrees from horizontal.

CERTIFYING ORGANIZATION is an independent organization recognized by the Commission to certify manufactured devices for performance values in accordance with procedures adopted by the Commission.

CLIMATE CONTROL SYSTEM (See SPACE CONDITIONING SYSTEM).

CLIMATE ZONES are the 16 geographic areas of California for which the Commission has established typical weather data, prescriptive packages and energy budgets. Climate zone boundary descriptions are in the document "California Climate Zone Descriptions" (July 1995), incorporated herein by reference. Figure 1-A is an approximate map of the 16 climate zones.

CMC means the 1998 California Mechanical Code prior to the effective date designated by the California Building Standards Commission for the 2000 California Mechanical Code. On and after the effective designated by the California Building Standards Commission for the 2000 California Mechanical Code, CMC shall mean the 2000 California Mechanical Code.

COEFFICIENT OF PERFORMANCE (COP), COOLING, is the ratio of the rate of net heat removal to the rate of total energy input, calculated under designated operating conditions and expressed in consistent units, as determined using the applicable test method in the Appliance Efficiency Regulations or Section 112.

COEFFICIENT OF PERFORMANCE (COP), HEATING, is the ratio of the rate of net heat output to the rate of total energy input, calculated under designated operating conditions and expressed in consistent units, as determined using the applicable test method in the Appliance Efficiency Regulations or Section 112.

COMMISSION is the California State Energy Resources Conservation and Development Commission.

COMPLETE BUILDING is an entire building with one occupancy making up 90 percent of the conditioned floor area (see also ENTIRE BUILDING).

CONDITIONED FLOOR AREA (CFA) is the floor area (in square feet) of enclosed conditioned space on all floors of a building, as measured at the floor level of the exterior surfaces of exterior walls enclosing the conditioned space.

CONDITIONED SPACE is space in a building that is either directly conditioned or indirectly conditioned. CONDITIONED VOLUME is the total volume (in cubic feet) of the conditioned space within a building.

CONSTRUCTION LAYERS are layers of material that make up a construction assembly.

<u>COOL ROOF</u> is a roofing material with high solar reflectance and high emittance that reduces heat gain through the roof.

COOLING EQUIPMENT is equipment used to provide mechanical cooling for a room or rooms in a building.

COURTYARD is an open space through one or more floor levels surrounded by walls within a building.

COVERED PRODUCT is an appliance regulated by the efficiency standards established under the National Appliance Energy Conservation Act, 42 U.S.C. Section 6291 et seq.

CRAWL SPACE is a space immediately under the first floor of a building adjacent to grade.

CTI is the Cooling Tower Institute.

C-VALUE (also known as C-FACTOR) is the time rate of heat flow through unit area of a body induced by a unit temperature difference between the body surfaces, in Btu/hr ft²-°F. It is not the same as K value or K factor.

DAYLIT AREA is the space on the floor that is the larger of (a) plus (b), or (c);

- (a) For areas daylit by vertical glazing, the daylit area has a length of 15 feet, or the distance on the floor, perpendicular to the glazing, to the nearest 60 inch or higher opaque partition, whichever is less; and a width of the window plus either 2 feet on each side, the distance to an opaque partition, or one half the distance to the closest skylight or vertical glazing, whichever is least.
- (b) For areas daylit by horizontal glazing, the daylit area is the footprint of the skylight plus, in each of the lateral and longitudinal dimensions of the skylight, the lesser of the floor to ceiling height, the distance to the nearest 60-inch or higher opaque partition, or one half the horizontal distance to the edge of the closest skylight or vertical glazing.
- (c) The daylit area calculated using a method approved by the Commission.

DECORATIVE GAS APPLIANCE is a gas appliance that is designed or installed for visual effect only, cannot burn solid wood, and simulates a fire in a fireplace.

DEGREE DAY, HEATING is a unit, based upon temperature difference and time, used in estimating fuel consumption and specifying nominal annual heating load of a building. For any one day, when the mean temperature is less than 65°F, there exist as many degree days as there are Fahrenheit degrees difference in temperature between the mean temperature for the day and 65°F. The number of degree days for specific geographical locations are those listed in the Residential Manual. For those localities not listed in the Residential Manual the number of degree days is as determined by the applicable enforcing agency.

DEMISING PARTITIONS are barriers that separate conditioned space from enclosed unconditioned space.

DEMISING WALL is a wall that is a demising partition.

DENSITY is the mass per unit volume of a construction material as documented in an ASHRAE handbook, a comparably reliable reference or manufacturer's literature.

DESIGN CONDITIONS are the parameters and conditions used to determine the performance requirements of space conditioning systems. Design conditions for determining design heating and cooling loads are specified in Section 144(b) for nonresidential, high rise residential, and hotel/motel buildings and in Section 150(h) for low rise residential buildings.

DESIGN HEAT GAIN RATE is the total calculated heat gain through the building envelope under design conditions.

DESIGN HEAT LOSS RATE is the total calculated heat loss through the building envelope under design conditions.

DIRECTLY CONDITIONED SPACE is an enclosed space that is provided with wood heating, is provided with mechanical heating that has a capacity exceeding 10 Btu/hr ft², or is provided with mechanical cooling that has a capacity exceeding 5 Btu/hr ft², unless the space conditioning system is designed and thermostatically controlled to maintain a process environment temperature less than 55°F or to maintain a process environment temperature greater than 90°F for

the whole space that the system serves, or unless the space conditioning system is designed and controlled to be incapable of operating at temperatures above 55°F or incapable of operating at temperatures below 90°F at design conditions.

DISPLAY LIGHTING is lighting confined to the area of a display that provides a higher level of illuminance than the level of surrounding ambient illuminance.

DISPLAY PERIMETER is the length of an exterior wall in a B, F-1, or M occupancy that immediately abuts a public sidewalk, measured at the sidewalk level for each story that abuts a public sidewalk.

DISPLAY, PUBLIC AREA are areas for the display of artwork, theme displays, and architectural surfaces in dining and other areas of public access, excluding restrooms and separate banquet rooms.

DISPLAY, SALES FEATURE is an item or items that requires special highlighting to visually attract attention and that is visually set apart from the surrounding area.

DISPLAY, SALES FEATURE FLOOR is a feature display in a retail store, wholesale store, or showroom that requires display lighting.

DISPLAY, SALES FEATURE WALL are the wall display areas, in a retail or wholesale space, that are in the vertical plane of permanent walls or partitions, and that are open shelving feature displays or faces of internally illuminated transparent feature display cases within the Gross Sales Wall Area.

DUAL GLAZED GREENHOUSE WINDOWS are a type of dual glazed fenestration product which adds conditioned volume but not conditioned floor area to a building.

<u>DUCT SEALING</u> is a procedure for installing a space conditioning distribution system that minimizes leakage of conditioned air. Minimum specifications for installation procedures, materials, diagnostic testing and field verification are contained in the Residential and Nonresidential ACM Approval Manuals.

EAST-FACING is oriented to within 45 degrees of true east, including 45°00'00" south of east (SE), but excluding 45°00'00" north of east (NE).

ECONOMIZER, AIR is a ducting arrangement and automatic control system that allows a cooling supply fan system to supply outside air to reduce or eliminate the need for mechanical cooling.

ECONOMIZER, WATER is a system by which the supply air of a cooling system is cooled directly or indirectly by evaporation of water, or other appropriate fluid, in order to reduce or eliminate the need for mechanical cooling.

EFFECTIVE APERTURE (EA) is (1) for windows, the visible light transmittance (VLT) times the window wall ratio; and (2) for skylights, the well index times the VLT times the skylight area times 0.85 divided by the gross exterior roof area.

EFFICACY is the ratio of light from a lamp to the electrical power consumed (including ballast losses), expressed in lumens per watt.

ENCLOSED SPACE is space that is substantially surrounded by solid surfaces.

ENERGY BUDGET is the maximum amount of source energy that a proposed building, or portion of a building, can be designed to consume, calculated with the approved procedures specified in Title 24, Part 6.

ENERGY EFFICIENCY RATIO (EER) is the ratio of net cooling capacity (in Btu/hr) to total rate of electrical energy (in watts), of a cooling system under designated operating conditions, as determined using the applicable test method in the Appliance Efficiency Regulations or Section 112.

ENERGY FACTOR (EF) is the ratio of energy output to energy consumption of a water heater, expressed in equivalent units, under designated operating conditions over a 24 hour use cycle, as determined using the applicable test method in the Appliance Efficiency Regulations.

ENERGY OBTAINED FROM DEPLETABLE SOURCES is electricity purchased from a public utility, or any energy obtained from coal, oil, natural gas, or liquefied petroleum gases.

ENERGY OBTAINED FROM NONDEPLETABLE SOURCES is energy that is not energy obtained from depletable sources

ENFORCING AGENCY is the city, county, or state agency responsible for issuing a building permit.

ENTIRE BUILDING is the ensemble of all enclosed space in a building, including the space for which a permit is sought, plus all existing conditioned and unconditioned space within the structure.

ENVELOPE means BUILDING ENVELOPE.

EXFILTRATION is uncontrolled outward air leakage from inside a building, including leakage through cracks and interstices, around windows and doors, and through any other exterior partition or duct penetration.

EXTERIOR DOOR is a door through an exterior partition that is opaque or has a glazed area that is less than or equal to one half of the door area. Doors with a glazed area of more than one half of the door area are treated as a fenestration product.

EXTERIOR FLOOR/SOFFIT is a horizontal exterior partition, or a horizontal demising partition, under conditioned space. For low rise residential occupancies, exterior floors also include those on grade.

EXTERIOR PARTITION is an opaque, translucent, or transparent solid barrier that separates conditioned space from ambient air or space that is not enclosed. For low rise residential occupancies, exterior partitions also include barriers that separate conditioned space from unconditioned space, or the ground.

EXTERIOR ROOF/CEILING is an exterior partition, or a demising partition, that has a slope less than 60 degrees from horizontal, that has conditioned space below, and that is not an exterior door or skylight.

EXTERIOR ROOF/CEILING AREA is the area of the exterior surface of exterior roof/ceilings.

EXTERIOR WALL is any wall or element of a wall, or any member or group of members, which defines the exterior boundries or courts of a building and which has a slope of 60 degrees or greater with the horizontal plane. An exterior wall or partition is not an exterior floor/soffit, exterior door, exterior roof/ceiling, window, or skylight, or demising wall.

EXTERIOR WALL AREA is the area of the opaque exterior surface of exterior walls.

FENESTRATION PRODUCT is any transparent or translucent material plus any sash, frame, mullions, and dividers, in the envelope of a building, including, but not limited to: windows, sliding glass doors, french doors, skylights, curtain walls, garden windows, and other doors with a glazed area of more than one half of the door area.

FENESTRATION SYSTEM means a collection of fenestration products included in the design of a building. (See "fenestration product")

FIELD-FABRICATED FENESTRATION PRODUCT OR EXTERIOR DOOR is a fenestration product or exterior door whose frame is made at the construction site of standard dimensional lumber or other materials that were not previously cut, or otherwise formed with the specific intention of being used to fabricate a fenestration product or exterior door. Field fabricated does not include site assembled frame components that were manufactured elsewhere with the intention of being assembled on site (such as knocked down products, sunspace kits and curtainwalls).

FIREPLACE is a hearth and firechamber or similar prepared place in which a solid fuel fire may be burned, as defined in UBC Section 3102.2 and as further clarified in UBC Section 3102.7; these include but are not limited to factory-built fireplaces, masonry fireplaces, and masonry heaters.

FLOOR/SOFFIT TYPE is a floor/soffit assembly having a specific heat capacity, framing type, and U value<u>U factor</u>.

FRAMED PARTITION or ASSEMBLY is a partition or assembly constructed using separate structural members spaced not more than 32 inches on center.

FRAMING PERCENTAGE is the fraction of the surface of a partition that is framed expressed in percentage.

GAS HEATING SYSTEM is a natural gas or liqueified petroleum gas heating system.

GAS LOG is a self-contained, free standing, open flame, gas burning appliance consisting of a metal frame or base supporting simulated logs, and designed for installation only in a vented fireplace.

GENERAL LIGHTING is lighting designed to provide a substantially uniform level of illumination throughout an area, exclusive of any provision for special visual tasks or decorative effect. When designed for lower than task illuminance used in conjunction with other specific task lighting systems, it is also called "ambient" lighting.

GLAZING (See FENESTRATION PRODUCT).

GOVERNMENTAL AGENCY is any public agency or subdivision thereof, including, but not limited to, any agency of the state, a county, a city, a district, an association of governments, or a joint power agency.

GROSS EXTERIOR ROOF AREA is the sum of the skylight area and the exterior roof/ceiling area.

GROSS EXTERIOR WALL AREA is the sum of the window area, door area, and exterior wall area.

GROSS SALES FLOOR AREA is the total area (in square feet) of retail store floor space that is (1) used for the display and sale of merchandise; or (2) associated with that function, including, but not limited to, sales transactions areas, fitting rooms, and circulation areas and entry areas within the space used for display and sale.

GROSS SALES WALL AREA is the area (in square feet) of the inside of exterior walls and permanent full height interior partitions within the gross sales floor area of a retail store that is used for the presentation of merchandise for sale, less the area of openings, doors, windows, baseboards, wainscots, mechanical or structural elements, and other obstructions preventing the use of the area for the presentation of merchandise.

HABITABLE STORY is a story that contains space in which humans may work or live in reasonable comfort, and that has at least 50 percent of its volume above grade.

HEAT CAPACITY (HC) of an assembly is the amount of heat necessary to raise the temperature of all the components of a unit area in the assembly one degree F. It is calculated as the sum of the average thickness times the density times the specific heat for each component, and is expressed in Btu per square foot per degree F.

HEAT PUMP is a device that is capable of heating by refrigeration, and that may include a capability for cooling.

HEATING EQUIPMENT is equipment used to provide mechanical heating for a room or rooms in a building.

HEATING SEASONAL PERFORMANCE FACTOR (HSPF) is the total heating output of a heat pump (in British thermal units) during its normal use period for heating divided by the total electrical energy input (in watt hours) during the same period, as determined using the applicable test method in the Appliance Efficiency Regulations.

HI is the Hydronics Institute.

HIGH BAY is a space with luminaires 25 feet or more above the floor.

HIGH-RISE RESIDENTIAL BUILDING is a building, other than a hotel/motel, of occupancy group R-1 with four or more habitable stories.

HORIZONTAL GLAZING (See SKYLIGHT).

HOTEL/MOTEL is a building or buildings incorporating six or more guest rooms or a lobby serving six or more guest rooms, where the guest rooms are intended or designed to be used, or which are used, rented, or hired out to be occupied, or which are occupied for sleeping purposes by guests, and all conditioned spaces within the same building envelope. Hotel/motel also includes all conditioned spaces which are (1) on the same property as the hotel/motel, (2) served by the same central HVAC system as the hotel/motel, and (3) integrally related to the functioning of the hotel/motel as such, including, but not limited to, exhibition facilities, meeting and conference facilities, food service facilities, lobbies, and laundries.

HVAC SYSTEM (see SPACE CONDITIONING SYSTEM).

ILLUMINATED FACE is a side of an exit sign that has the word "EXIT" on it.

INDIRECTLY CONDITIONED SPACE is enclosed space including, but not limited to, unconditioned volume in atria, that (1) is not directly conditioned space; and (2) either (a) has an area weighted heat transfer coefficient to directly conditioned space exceeding that to the outdoors or to unconditioned space, or (b) is a space through which air from directly conditioned spaces is transferred at a rate exceeding 3 air changes per hour.

INFILTRATION is uncontrolled inward air leakage from outside a building, or unconditioned space, including leakage through cracks and interstices, around windows and doors, and through any other exterior or demising partition or pipe or duct penetration.

INTEGRATED PART LOAD VALUE (IPLV) is a single number figure of merit based on part load EER or COP expressing part load efficiency for air conditioning and heat pump equipment on the basis of weighted operation at various load capacities for the equipment as determined using the applicable test method in the Appliance Efficiency Regulations or Section 112.

ISOLATION DEVICE is a device that prevents the conditioning of a zone or group of zones in a building while other zones of the building are being conditioned.

LOW BAY is a space with luminaires less than 25 feet above the floor.

LOW RISE RESIDENTIAL BUILDING is a building, other than a hotel/motel, that is of occupancy group R-1 and is three stories or less, or that is of occupancy group R-3.

LPG is Liqueified Petroleum Gas.

LUMEN MAINTENANCE DEVICE is a device capable of automatically adjusting the light output of a lighting system throughout a continuous range to provide a preset level of illumination.

LUMINAIRE is a complete lighting unit consisting of a lamp and the parts designed to distribute the light, to position and protect the lamp, and to connect the lamp to the power supply; commonly referred to as "lighting fixtures" or "instruments."

MANUAL is capable of being operated by personal intervention.

MANUFACTURED DEVICE is any heating, cooling, ventilation, lighting, water heating, refrigeration, cooking, plumbing fitting, insulation, door, fenestration product, or any other appliance, device, equipment, or system subject to Sections 110 through 119 of Title 24, Part 6.

MANUFACTURED FENESTRATION PRODUCT is a fenestration product typically assembled before delivery to a job site. "Knocked down" or partially assembled products sold as a fenestration product must be considered a manufactured fenestration product and meet the rating and labeling requirements for manufactured fenestration products.

MECHANICAL COOLING is lowering the temperature within a space using refrigerant compressors or absorbers, desiceant dehumidifiers, or other systems that require energy from depletable sources to directly condition the space. In nonresidential, high-rise residential, and hotel/motel buildings cooling of a space by direct or indirect evaporation of water alone is not considered mechanical cooling.

MECHANICAL HEATING is raising the temperature within a space using electric resistance heaters, fossil fuel burners, heat pumps, or other systems that require energy from depletable sources to directly condition the space.

MODELING ASSUMPTIONS are the conditions (such as weather conditions, thermostat settings and schedules, internal gain schedules, etc.) that are used for calculating a building's annual energy consumption and that are in the Alternative Calculation Methods Manuals.

MOVABLE SHADING DEVICE (See OPERABLE SHADING DEVICE).

MULTI-SCENE DIMMING SYSTEM is a lighting control device that has the capability of setting light levels throughout a continuous range, and that has pre-established settings within the range.

NEWLY CONDITIONED SPACE is any space being converted from unconditioned to directly conditioned or indirectly conditioned space. Newly conditioned space must comply with the requirements for an addition. See Section 149 for nonresidential occupancies and Section 152 for residential occupancies.

NONRESIDENTIAL BUILDING is any building which is of occupancy group A, B, E, or H.

NOTE: Requirements for high rise residential buildings and hotels/motels are included in the nonresidential sections of Title 24, Part 6.

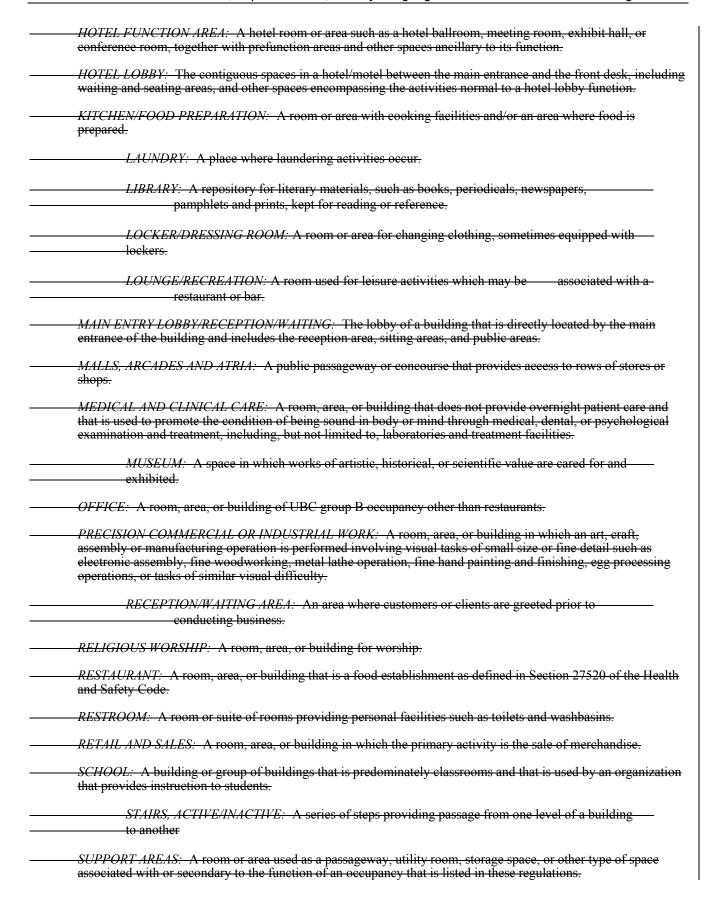

NONRESIDENTIAL MANUAL is the manual developed by the Commission, under Section 25402.1(e) of the Public Resources Code, to aid designers, builders and contractors in meeting the energy efficiency requirements for nonresidential, high rise residential, and hotel/motel buildings.

NORTH-FACING is oriented to within 45 degrees of true north, including 45°00'00" east of north (NE), but excluding 45°00'00' west of north (NW).

OCCUPANCY SENSOR, LIGHTING is a device that automatically turns lights off soon after an area is vacated.

OCCUPANCY TYPE is one of the following:
AUDITORIUM: The part of a public building where an audience sits in fixed seating, or a room, area, or building with fixed seats used for public meetings or gatherings not specifically for the viewing of dramatic performances.
AUTO REPAIR: The portion of a building used to repair automotive equipment and/or vehicles, exchange parts, and may include work using an open flame or welding equipment. BANK/FINANCIAL INSTITUTION: An area in a public establishment for conducting financial transactions including the custody, loan, exchange, or issue of money, for the extension of credit, and for facilitating the transmission of funds.
CLASSROOM, LECTURE, OR TRAINING: A room or area where an audience or class receives instruction.
COMMERCIAL AND INDUSTRIAL STORAGE: A room, area, or building used for storing items.
 CONVENTION, CONFERENCE, MULTIPURPOSE AND MEETING CENTERS: An assembly room, area, or building that is used for meetings, conventions and multiple purposes including, but not limited to, dramatic performances, and that has neither fixed seating nor fixed staging.
CORRIDOR: A passageway or route into which compartments or rooms open.
DINING: A room or rooms in a restaurant or hotel/motel (other than guest rooms) where meals that are served to the customers will be consumed.
— ELECTRICAL/MECHANICAL ROOM: A room in which the building's electrical switchbox or — control panels and/or HVAC controls or equipment is located.
EXERCISE CENTER/GYMNASIUM: A room or building equipped for gymnastics, exercise equipment, or indoor athletic activities.
EXHIBIT: A room or area that is used for exhibitions that has neither fixed seating nor fixed staging.
GENERAL COMMERCIAL AND INDUSTRIAL WORK: A room, area, or building in which an art, craft, assembly or manufacturing operation is performed.
HIGH BAY: Luminaires 25 feet or more above the floor.
LOW BAY: Luminaires less than 25 feet above the floor.
— GROCERY STORE: A room, area, or building that has as its primary purpose the sale of foodstuffs requiring

additional preparation prior to consumption.

THEATER, MOTION PICTURE: An assembly room, hall, or building with tiers of rising seats or steps for the showing of motion pictures.

THEATER, PERFORMANCE: An assembly room, hall, or building with tiers of rising seats or steps for the viewing of dramatic performances, lectures, musical events and similar live performances.

VOCATIONAL ROOM: A room used to provide training in a special skill to be pursued as a trade.

WHOLESALE SHOWROOM: A room where samples of merchandise are displayed.

OPERABLE SHADING DEVICE is a device at the interior or exterior of a building or integral with a fenestration product, which is capable of being operated, either manually or automatically, to adjust the amount of solar radiation admitted to the interior of the building.

OPTIMAL OVERHANG is an overhang that completely shades the glazing at solar noon on August 21 and substantially exposes the glass at solar noon on December 21.

ORNAMENTAL CHANDELIERS are ceiling mounted, close to ceiling, or suspended decorative luminaires that use glass, crystal, ornamental metals, or other decorative material and that typically are used in hotel/motels, restaurants, or churches as a significant element in the interior architecture.

OUTDOOR AIR (Outside air) is air taken from outdoors and not previously circulated in the building.

OVERALL HEAT GAIN is the value obtained in Section 143(b)2 for determining compliance with the component envelope approach.

OVERALL HEAT LOSS is the value obtained in Section 143(b)1 for determining compliance with the component envelope approach.

PLENUM is an air compartment or chamber, including uninhabited crawl space, areas above a ceiling or below a floor, including air spaces below raised floors of computer/data processing centers, or attic spaces, to which one or more ducts are connected and which forms part of either the supply air, return air or exhaust air system, other than the occupied space being conditioned.

POOR QUALITY LIGHTING TASKS are visual tasks that require illuminance category "E" or greater, because of the choice of a writing or printing method that produces characters that are of small size or lower contrast than good quality alternatives that are regularly used in offices.

PRIVATE OFFICE or **WORK AREA** is an office bounded by 30 inch or higher partitions and is no more than 200 square feet.

PROCESS is an activity or treatment that is not related to the space conditioning, lighting, service water heating, or ventilating of a building as it relates to human occupancy.

PROCESS LOAD is a load resulting from a process.

PUBLIC AREAS are spaces generally open to the public at large, customers, congregation members, or similar spaces, where occupants need to be prevented from controlling lights for safety, security, or business reasons.

PUBLIC FACILITY RESTROOM is a restroom designed for use by the public.

RAISED FLOOR is a floor (partition) over a crawl space, or an unconditioned space, or ambient air.

RADIANT BARRIER is any reflective material that has an emittance of 0.05 or less, tested in accordance with ASTM C 1371 98, and that is certified to the California Department of Consumer Affairs.

READILY ACCESSIBLE is capable of being reached quickly for operation, repair, or inspection, without requiring climbing or removing obstacles, or resorting to access equipment.

RECOOL is the cooling of air that has been previously heated by space conditioning equipment or systems serving the same building.

RECOVERED ENERGY is energy used in a building that (1) is mechanically recovered from space conditioning, service water heating, lighting, or process equipment after the energy has performed its original function; (2) provides space conditioning, service water heating, or lighting; and (3) would otherwise be wasted.

REDUCED FLICKER OPERATION is the operation of a light, in which the light has a visual flicker less than 30% for frequency and modulation.

REFERENCE COMPUTER PROGRAM is the DOE 2.1E program, version 86. Note that the *reference computer program* is only part of the *reference method* which is the official set of procedures and additional calculational algorithms, that uses the the official rules and assumptions along with the *reference computer program* to manipulate required inputs to:

- 1) describe the salient, energy consuming features of a proposed building design; and to
- 2) create and describe relevant energy-consuming aspects of a standard building design that meets the prescriptive building energy efficiency standards; and to
- 3) simulate both proposed and standard building designs and determine if the energy consumption of the proposed building is less than the standard building; and to
- 4) print a specific set of required compliance forms if and only if the calculated energy budget for the standard building design is greater than the proposed building design.

In the absence of other information to the contrary, the *reference method* is described in the most detail in the *reference method* input files in the Supplement to this manual.

REHEAT is the heating of air that has been previously cooled by cooling equipment or systems or an economizer.

RELATIVE SOLAR HEAT GAIN is the ratio of solar heat gain through a fenestration product (corrected for external shading) to the incident solar radiation. sSolar heat gain includes directly transmitted solar heat and absorbed solar radiation, which is then reradiated, conducted, or convected into the space.

REPAIR is the reconstruction or renewal of any part of an existing building for the purpose of its maintenance. Note: Repairs to low rise residential buildings are not within the scope of these standards.

RESIDENTIAL BUILDING (See HIGH RISE RESIDENTIAL BUILDING and LOW RISE RESIDENTIAL BUILDING).

RESIDENTIAL MANUAL is the manual developed by the Commission, under Section 25402.1(c) of the Public Resources Code, to aid designers, builders, and contractors in meeting energy efficiency standards for low rise residential buildings.

ROOF is the exterior surface on the top of a building, which has a slope less than 60 degrees from horizontal.

ROOF/CEILING TYPE is a roof/ceiling assembly having a specific framing type and U-factorU value.

ROOM CAVITY RATIO (RCR) is:

Where:

<u>L</u> =_	Length of room	
W =	Width of room	
	Wildin of Foom	

H = Vertical distance from the work plane to the center line of the lighting fixture

P - Perimeter of room

A = Area of room

RUNOUT is piping that is no more than 12 feet long and that is connected to a fixture or an individual terminal unit.

SCONCE is a wall mounted decorative light fixture.

SEASONAL ENERGY EFFICIENCY RATIO (SEER) means the total cooling output of a central air conditioner in British thermal units during its normal usage period for cooling divided by the total electrical energy input in watt hours during the same period, as determined using the applicable test method in the Appliance Efficiency Regulations.

SEMI-CONDITIONED SPACE is an enclosed nonresidential space that is provided with wood heating, cooling by direct or indirect evaporation of water, mechanical heating that has a capacity of 10 Btu/(hr ft²) or less, mechanical cooling that has a capacity of 5 Btu/(hr ft²) or less, or is maintained for a process environment as set forth in the definition of DIRECTLY CONDITIONED SPACE.

SERVICE WATER HEATING is heating of water for sanitary purposes for human occupancy, other than for comfort heating.

SHADING is the protection from heat gains because of direct solar radiation by permanently attached exterior devices or building elements, interior shading devices, glazing material, or adherent materials. Permanently attached means (a) attached with fasteners that require additional tools to remove (as opposed to clips, hooks, latches, snaps, or ties); or (b) required by the UBC for emergency egress to be removable from the interior without the use of tools.

SHADING COEFFICIENT (SC) is the ratio of the solar heat gain through a fenestration product to the solar heat gain through an unshaded 1/8 inch thick clear double strength glass under the same set of conditions. For nonresidential, high-rise residential, and hotel/motel buildings, this shall exclude the effects of mullions, frames, sashes, and interior and exterior shading devices.

SITE-ASSEMBLED FENESTRATION includes both field-fabricated fenestration and site-built fenestration.

SITE-BUILT FENESTRATION PRODUCTS are fenestration products designed to be field-glazed or field assembled units comprised of specified framing and glazing components. Site-built fenestration is eligible for certification under NFRC 100-SB, and may include both vertical glazing and horizontal glazing.

SITE SOLAR ENERGY is natural daylighting, or thermal, chemical, or electrical energy derived from direct conversion of incident solar radiation at the building site.

SKYLIGHT is glazing having a slope less than 60 degrees from the horizontal with conditioned space below, except for purposes of complying with Section 151(f), where a skylight is glazing having a slope not exceeding 4.76 degrees (1:12) from the horizontal.

SKYLIGHT AREA is the area of the surface of a skylight, plus the area of the frame, sash, and mullions.

SKYLIGHT TYPE is a type of skylight assembly having a specific solar heat gain coefficient, whether translucent or transparent, and U value U factor, whether glass mounted on a curb, glass not mounted on a curb or plastic (assumed to be mounted on a curb).

SMACNA is the Sheet Metal and Air-conditioning Contractors National Association.

SOLAR HEAT GAIN COEFFICIENT (SHGC) is the ratio of the solar heat gain entering the space through the fenestration area to the incident solar radiation. Solar heat gain includes directly transmitted solar heat and absorbed solar radiation, which is then reradiated, conducted, or convected into the space.

SOURCE ENERGY is the energy that is used at a site and consumed in producing and in delivering energy to a site, including, but not limited to, power generation, transmission, and distribution losses, and that is used to perform a specific function, such as space conditioning, lighting or water heating. Table 1-B contains the conversion factors for converting site to source energy.

SOUTH-FACING is oriented to within 45 degrees of true south including 45°00'00" west of south (SW), but excluding 45°00'00" east of south (SE).

SPA is a vessel that contains heated water, in which humans can immerse themselves, is not a pool, and is not a bathtub.

SPACE CONDITIONING SYSTEM is a system that provides either collectively or individually heating, ventilating, or cooling within or associated with conditioned spaces in a building.

SPECIFIC HEAT is the quantity of heat that must be supplied to a unit mass of the material to increase its temperature by one degree as documented in an ASHRAE handbook, a comparably reliable reference or manufacturer's literature.

SYSTEM is a combination of equipment, controls, accessories, interconnecting means, or terminal elements, by which energy is transformed to perform a specific function, such as space conditioning, service water heating, or lighting.

TASK-ORIENTED LIGHTING is lighting that is designed specifically to illuminate a task location, and that is generally confined to the task location.

THERMAL CONDUCTIVITY is the quantity of heat that will flow through a unit area of the material per hour when the temperature difference through the material is one degree as documented in an ASHRAE handbook, a comparably reliable reference or manufacturer's literature.

THERMAL MASS is solid or liquid material used to store heat for later heating use or for reducing cooling requirements.

THERMAL RESISTANCE (R) is the resistance of a material or building component to the passage of heat in hr-ft²
°F/Btu.

THERMOSTATIC EXPANSION VALVE (TXV) is a refrigerant metering valve, installed in an air conditioner or heat pump, which controls the flow of liquid refrigerant entering the evaporator in response to the superheat of the gas leaving it.

THROW DISTANCE is the distance between the luminaire and the center of the plane lit by the luminaire on a display.

TUNING is a lighting control device that allows authorized personnel only to select a single light level within a continuous range.

UBC is the 1994 edition of the state adopted Uniform Building Code, Title 24.

UL is the Underwriters Laboratory.

UMC is the 1997 edition of the state adoted Uniform Mechanical Code.

UNCONDITIONED SPACE is enclosed space within a building that is not directly conditioned, indirectly conditioned, or semi-conditioned space.

UNIT INTERIOR MASS CAPACITY (UIMC) is the amount of effective heat capacity per unit of thermal mass, taking into account the type of mass material, thickness, specific heat, density and surface area.

U-VALUE U-FACTOR is the overall coefficient of thermal transmittance of a construction assembly, in Btu/h ft²-eF, including air film resistance at both surfaces.

VAPOR BARRIER is a material that has a permeance of one perm or less and that provides resistance to the transmission of water vapor.

VARIABLE AIR VOLUME (VAV) SYSTEM is a space conditioning system that maintains comfort levels by varying the volume of conditioned air to the zones served.

VERTICAL GLAZING (See "window")

VERY VALUABLE MERCHANDISE is rare or precious objects, including, but not limited to, jewelry, coins, small art objects, crystal, china, ceramics, or silver, the selling of which involves customer inspection of very fine detail from outside of a locked case.

VISIBLE LIGHT TRANSMITTANCE (VLT) is the ratio (expressed as a decimal) of visible light that is transmitted through a glazing material to the light that strikes the material.

WALL TYPE is a wall assembly having a specific heat capacity, framing type, and U-value <u>U-factor</u>.

WELL INDEX is the ratio of the amount of visible light leaving a skylight well to the amount of visible light entering the skylight well and is calculated as follows:

- Or			
(b) for irregular	shaped wells:		

WEST-FACING is oriented to within 45 degrees of true west, including 45⁹00'00" north of due west (NW), but excluding 45⁹00'00" south of west (SW).

WINDOW is glazing that is not a skylight.

WINDOW AREA is the area of the surface of a window, plus the area of the frame, sash, and mullions.

WINDOW TYPE is a window assembly having a specific solar heat gain coefficient, relative solar heat gain, and U-valueU-factor.

WINNDOW WALL RATIO is the ratio of the window area to the gross exterior wall area.

WOOD HEATER is an enclosed wood burning appliance used for space heating and/or domestic water heating, and which meets the definition in Federal Register, Volume 52, Number 32, February 18, 1987.

WOOD STOVE (See WOOD HEATER).

ZONE, **LIGHTING** is a space or group of spaces within a building that has sufficiently similar requiremnts so that lighting can be automatically controlled in unison throughout the zone by an illumination controlling device or devices, and does not exceed one floor.

ZONE, SPACE CONDITIONING is a space or group of spaces within a building with sufficiently similar comfort conditioning requirements so that comfort conditions, as specified in 144(b)3 or 150(h), as applicable, can be maintained throughout the zone by a single controlling device.

ACM NG-2005

Standard Procedure for Determining the Seasonal Energy Efficiencies of Single-Zone Nonresidential Air Distribution Systems in <u>Buffer Spaces or Outdoors</u>the Space Between an Insulated Ceiling and the Roof

NG.1 Purpose and Scope

ACM NG contains procedures for measuring the air leakage in single zone, nonresidential air distribution systems and for calculating the annual and hourly duct system efficiency for energy calculations. The methods described here apply to single zone, constant volume heating and air conditioning systems serving zones with 5000 ft² of floor area or less, with duct systems located in unconditioned or semi-conditioned buffer spaces or outdoors. These calculations apply to new buildings or new air conditioning systems applied to existing buildings.

NG.1 Introduction

This appendix describes the measurement and calculation methods for determining air distribution system efficiency for single zone non residential air distribution systems in the space between an insulated ceiling and the roof.

NG.2 Definitions

aerosol sealant closure system: A method of sealing leaks by blowing aerosolized sealant particles into the duct system and-which must include minute-by-minute documentation of the sealing process.

buffer space: an unconditioned or indirectly conditioned space located between a ceiling and the roof.

floor area: The floor area of enclosed conditioned space on all floors of a building, as measured at the floor level of the exterior surfaces enclosing the conditioned space.

<u>cool roof-:</u> a roofing material with high thermal emittance and high solar reflectance, or lower thermal emittance and exceptionally high solar reflectance as specified in Standards § 118 (i) that reduces heat gain through the roof.

delivery effectiveness-:_The ratio of the thermal energy delivered to the conditioned space and the thermal energy entering the distribution system at the equipment heat exchanger.

distribution system efficiency-:_The ratio of the thermal energy consumed by the equipment with the distribution system to the energy consumed if the distribution system had no losses or impact on the equipment or building loads.

equipment efficiency-:_The ratio between the thermal energy entering the distribution system at the equipment heat exchanger and the energy being consumed by the equipment.

equipment factor: _F_{equip} is the ratio of the equipment efficiency including the effects of the distribution system to the equipment efficiency of the equipment in isolation.

fan flowmeter device: _A device used to measure air flow rates under a range of test pressure differences.

floor area: The floor area of enclosed conditioned space on all floors of a building, as measured at the floor level of the exterior surfaces enclosing the conditioned space.

Flow capture hood: A device used to capture and measure the airflow at a register.

load factor: F_{load} is the ratio of the building energy load without including distribution effects to the load including distribution system effects.

pressure pan: a device used to seal individual forced air system registers and to measure the static pressure from the register.

radiant barrier: a surface of low emissivity (less than 0.05) placed inside an attic or roof space to reduce radiant heat transfer.

recovery factor: F_{recov} is the fraction of energy lost from the distribution system that enters the conditioned space.

thermal regain: The fraction of delivery system losses that are returned to the building.

NG.3 Nomenclature

 a_r = duct leakage factor (1-return leakage) for return ducts

a_s = duct leakage factor (1-supply leakage)p for supply ducts

Aduct buffer = total supply plus return duct area in buffer space, ft²

A_{duct,outdoor} = total supply plus return duct area located outdoors, ft²

A_{duct,n} = total supply plus return duct area in space n, ft²

A_{floor} = -conditioned floor area of building, ft²

A_{r.out} = surface area of return duct outside conditioned space ,ft²

A_{r.buffer} = return duct surface area in buffer space, ft²

A_{r,total} = total return duct surface area, ft²

A_{rattic} = return duct area in attic, ft²

A_{r,base} = return duct area in basement, ft²

A. = return duct area in crawlspace, ft²

A_{r.gar}= return duct area inside garage, ft²

A_{s out} = surface area of supply duct outside conditioned space, ft²

 $A_{s,buffer}$ = supply duct surface area in buffer space, ft²

A_{s,total} = total supply duct surface area, ft²

A_{sattic} = supply duct area in attic, ft²

A_{s.base} = supply duct area in basement, ft²

A_{s.crawl} = supply duct area in crawlspace,ft²

A_{s.gar} = supply duct area inside garage, ft²

A_{s.in} = supply duct area inside conditioned space, ft²

Awalls = area of buffer space exterior walls, ft²

 A_{roof} = area of buffer space roof, ft^2

 B_r = conduction fraction for return

 B_s = conduction fraction for supply

 C_p = specific heat of air = 0.24 Btu/(lb·°F)

 C_{DT} , C_0 , C_R , C_L regression coefficients for hourly model

DE = delivery effectiveness

DE_{design} = design delivery effectiveness

DE_{seasonal} = seasonal delivery effectiveness

E_{equip} = rate of energy exchanged between equipment and delivery system, Btu/hour

 \underline{E}_{hr} = hourly HVAC system energy input (kW for electricity, therms for gas)

 F_{cycloss} = cyclic loss factor

 F_{equip} = load factor for equipment

F_{flow} = load factor for fan flow effect on equipment efficiency

F_{leak} = fraction of system fan flow that leaks out of supply or return ducts

 F_{load} = load factor for delivery system

 F_{recov} = thermal loss recovery factor

 F_{regain} = thermal regain factor

 h_0 = outside roof surface convection coefficient, = 3.4 Btu/hr ft²°F

 I_{hor} = global solar radiation on horizontal surface, Btu/hr ft²

K_r = return duct surface area coefficient

K_s = supply duct surface area coefficient

 N_{story} = number of stories of the building

P_{sp} = pressure difference between supply plenum and conditioned space [Pa]

P_{test} = test pressure for duct leakage [Pa]

Q_{buffer} = buffer space infiltration rate, cfm

 $Q_e = Flow through air handler fan at operating conditions, cfmFlow through air handler at 400 cfm/rated ton with rated tons defined by unit scheduled capacity at the conditions the unit's ARI rating standard from Section 112 of the Standard. Airflow through heating only furnaces shall be based on a 21.7 cfm/kBtuh rated output capacity.$

Qtotal,25 = total duct leakage at 25 Pascal, cfm

R_r = thermal resistance of return duct, h ft² <u>°</u>F/Btu

R_s = thermal resistance of supply duct, h ft² <u>°</u>F/Btu

 $T_{amb,cool}$ = cooling season ambient temperature, °F

T_{amb,heat} = heating season ambient temperature, °F

 $T_{amb,r}$ = ambient temperature for return-, ${}^{\circ}F$

T_{amb.s} = ambient temperature for supply-, °F

Tattic = attic air temperature, F

Thase - return duct temperature in basement, F

T_{crawl} - return duct temperature in crawlspace, F

T_{design} = outdoor air design temperature, F

T_{ground} = ground temperature , F

T_{gar} = temperature of garage air , F

T_{in} = temperature of indoor air-, °F

T_{rp} = return plenum air temperature, F

T_{seasonal} = outdoor air seasonal temperature, F

T_{solair} = sol-air temperature, °F

T_{sp} = supply plenum air temperature-, °F

UA_c = UA value for the interface between the conditioned space and the buffer space, Btu/°F

<u>UA_{walls} = UA value for the buffer space exterior walls, Btu/°F</u>

- <u>UA_{roof} = UA value for the buffer space exterior roof, Btu/°F</u>
- UA_c = UA value for the interface between the conditioned space and the buffer space, Btu/°F
- ZLC_c = zone loss coefficient for the interface between the conditioned space and the buffer space, Btu/°F
- ZLC_{total} = sum of all the zone loss coefficients for the buffer space, Btu/°F
- $\underline{\alpha}$ = solar absorptivity of roof, = 0.70 for standard roof; 0.45 for cool roof, 0.0 for ducts located outdoors
- ΔT_e = temperature rise across heat exchanger-, °F
- ΔT_r = temperature difference between indoors and the ambient for the return-, ${}^{\circ}F$
- ΔT_s = temperature difference between indoors and the ambient for the supply, $\underline{\,}^{\circ}F$
- ΔT_{sky} = reduction of sol-air temperature due to sky radiation, = 6.5°F for standard roof and cool roof, 0.0°F for ducts located outdoors, °F.
- $\Delta T_{sol,hr}$ = hourly difference between sol-air and indoor temperatures, °F
- ΔT_{sol_season} = energy weighted seasonal average difference between sol-air and indoor temperatures, °F
- $\underline{\eta_{adi,hr}}$ = hourly distribution efficiency adjustment factor
- $\eta_{\text{dist},\text{seasonal}}$ = seasonal distribution system efficiency
- $\underline{\eta_{dist,hr}} = \text{hourly distribution system efficiency}$
- ρ = density of air = 0.075, lb/ft³

NG.4 Air Distribution Diagnostic Measurement and Default Assumptions

NG.4.1 Instrumentation Specifications

The instrumentation for the air distribution diagnostic measurements shall conform to the following specifications:

NG.4.1.1 Pressure Measurements

All pressure measurements shall be measured with measurement systems (i.e. sensor plus data acquisition system) having an accuracy of \pm 0.2 Pa. All pressure measurements within the duct system shall be made with static pressure probes.

NG.4.1.2 Fan Flow Measurements

All measurements of distribution fan flows shall be made with measurement systems (i.e. sensor plus data acquisition system) having an accuracy of ±5% reading or ±5 cfm whichever is greater.

NG.4.1.23 Duct Leakage Measurements

The measurement of air flows during duct leakage testing shall have an accuracy of $\pm 3\%$ of measured flow using digital gauges.

All instrumentation used for fan flow and duct leakage diagnostic measurements shall be calibrated according to the manufacturer's calibration procedure to conform to the above accuracy requirement. All testers performing diagnostic tests shall obtain evidence from the manufacturer that the equipment meets the accuracy specifications. The evidence shall include equipment model, serial number, the name and signature of the person of the test laboratory verifying the accuracy, and the instrument accuracy. All diagnostic testing equipment is subject to re-calibration when the period of the manufacturer's guaranteed accuracy expires.

NG.4.2 Apparatus

NG.4.2.1 Duct Leakage Pressurization

The apparatus for fan pressurization duct leakage measurements shall consist of a duct pressurization and flow measurement device meeting the specifications in Section NG.4.1.23.

NG.4.3 Procedure

The following sections identify input values for building and HVAC system (including ducts) using either default or diagnostic information.

NG.4.3.1 Building Information and Defaults

The calculation procedure for determining air distribution efficiencies requires the following building information:

- 1. climate zone for the building,
- conditioned floor area, and
- 3. number of stories.
- 4. areas and U-values of surfaces enclosing space between the roof and a ceiling, and
- 5. surface area of ductwork if ducts are located outdoors or in multiple spaces.

NG4.3.1.1 Default Input

Using default values rather than diagnostic procedures produce relatively low air distributionsystem efficiencies.

Default values shall be obtained from following sections:

- 1. the location of the duct system in Section NG.4.3.4,
- the surface area and insulation level of the ducts in Sections NG.4.3.3, NG.4.3.4 and NG.4.3.6,
- 3. the system fan flow in Section NG.4.3.7, and
- 4. the leakage of the duct system in Section NG.4.3.8.

NG.4.3.2 Diagnostic Input

Diagnostic inputs are used for the calculation of improved duct efficiency. The diagnostics include observation of various duct characteristics and measurement of duct leakage and system fan flows as described in Sections NG.4.3.5 through NG.4.3.8. These observations and measurements replace those assumed as default values.

The diagnostic procedures include:

- Mmeasurement of total duct system leakage as described in Section NG.4.3.8.
- Measurement of duct surface area if ducts are located outdoors or in multiple spaces as described in Section 4.3.3.
- Observe Observation of the insulation level for the supply (R_s) and return (R_r) ducts outside the conditioned space as described in Section NG.4.3.6.
- Observe ation of the presence of a cool roof.
- Observation of thee presence of an outdoor air economizer.

NG.4.3.3 Duct Surface Area

The supply-side and return-side duct surface areas shall be calculated separately. If the supply or return duct is located in more than one-zonespace, the area of that duct in each zonespace shall may shall be calculated separately. The duct surface area shall be determined using one of the following methods.

NG.4.3.3.1 Default Duct Surface Area

The <u>default</u> duct surface area for supply and return shall be calculated as follows:

For supplies:

Equation NG-1	$A_{s,total} =$	Ks Afloor

Where K_s (supply duct surface area coefficient) shall be $4\underline{-0.25}$ for systems serving the topone story buildings only, 0.125 for systems serving the top story plus one other two story buildings, and 0.0833 for systems servings three or more stories story buildings.

For returns:

 $\label{eq:approx} \underline{\text{Equation NG-2}} \quad \underline{A_{r,total}} = K_r \quad A_{floor}$

Where K_r (return duct surface area coefficient) shall be $0.\underline{105}$ for systems serving the top story only, 0.125 for systems serving the top story plus one other, and 0.08 for systems servings three or more stories.

If ducts are located outdoors, the outdoor duct surface area shall be calculated from the duct layout on the plans using measured duct lengths and nominal inside diameters (for round ducts) or inside perimeters (for rectangular ducts) of each outdoor duct run in the building that is within the scope of the calculation procedure. When using the default duct area, outdoor supply duct surface area shall be less than or equal to the default supply duct surface area; outdoor return duct surface area shall be less than or equal to the default return duct surface area.

The surface area of ducts located in the buffer space between ceilings and roofs shall be calculated from:

Equation NG-3 $A_{s,buffer} = A_{s,total} - A_{s,outdoors}$

Equation NG-4 $A_{r,buffer} = A_{r,total} - A_{r,outdoors}$

NG4.3.3.2 Measured Duct Surface Area

Measured duct surface areas shall be used when the outdoor duct surface area measured from the plans is greater than default duct surface area for either supply ducts or return ducts. If a duct system passes through multiple spaces that have different ambient temperature conditions as specified in Section 4.3.5, the duct surface area shall be measured for each space individually. The duct surface area shall be calculated from measured duct lengths and nominal inside diameters (for round ducts) or inside perimeters (for rectangular ducts) of each duct run located in buffer spaces or outdoors.

NG.4.3.4 Duct Location

Duct systems covered by this procedure are those specified in the Standards § 144(k)3.

Ducts shall be considered to be installed in spaces between ceilings and roofs or building exteriors if more than 50 lineal feet of duct or 75 percent of the duct surface area is located in a space between an insulated ceiling and the roof, and that space is either a) vented to the outdoors, and/or b) insulated from the indoors.

NG.4.3.5 Climate and Duct Ambient Conditions for Ducts in the Space Between an Insulated Ceiling and the Roof

Duct ambient temperatures for both heating and cooling shall be obtained from Tables NG-1a to NG-1e. The duct ambient temperatures for the cool roofs from Table NG-1c shall be used for ducts located in unconditioned spaces other than attics and outside. Indoor dry-bulb (T_{in}) temperature -for cooling is 78°F. The indoor dry-bulb temperature for heating is 70°F.

NG.4.3.6 Duct Wall Thermal Resistance

NG.4.3.6.1 Default Duct Insulation R value

Default duct wall thermal resistance for new buildings is R-8.04.2, the mandatory requirement for ducts installed in newly constructed buildings, additions and new or replacement ducts installed in existing buildings. Default duct wall thermal resistance for existing ducts in existing buildings is R-4.2. An air film resistance of 0.7 [h ft² °F/BTU] shall be added to the duct insulation R value to account for external and internal film resistance.

NG.4.3.6.2 Diagnostic Duct Wall Thermal Resistance

Duct wall thermal resistance shall be determined from the manufacturer's specification observed during diagnostic inspection. If ducts with multiple R values are installed, the lowest duct R value shall be used. If a duct with a higher R value than 8.04.2 is installed, the R-value shall be clearly stated on the building plans and a visual inspection of the ducts must be performed to verify the insulation values. In case the space on top of the duct boot is limited and can not be inspected, the insulation R value within two feet of the boot to which the duct is connected may be excluded from the determination of the overall system R value.

NG.4.3.7 System Total Fan Flow

NG.4.3.7.1 Default Fan Flow

The default cooling total fan flow with for an air conditioner and for heating with or a heat pump for all climate zones shall be calculated as follows:

 $Q_e = 1.25 A_{floor} - (4.3)$

equal to 400 cfm/rated ton with rated tons defined by unit scheduled capacity at the conditions the unit's ARI rating standard from Section 112 of the Standard. Airflow through heating only furnaces shall be based on 21.7 cfm/kBtuh rated output capacity.

NG.4.3.8 Duct Leakage

NG.4.3.8.1 Duct Leakage Factor for Delivery Effectiveness Calculations

Default duct leakage factors <u>for the Proposed Design</u> shall be obtained from Table NG-2, using the "not Tested" values.

<u>Duct leakage factors for the Standard Design shall be obtained from Table NG-2, using the appropriate "Tested" value.</u>

Duct leakage factors shown in Table NG-2 shall be used in calculations of delivery effectiveness.

Table NG-2 Duct Leakage Factors

	Duct Leakage Diagnostic Test Performed using Section 4.3.8.2 Procedures	as = ar =
<u>Untested d</u> Duct systems in buildings built prior to <u>June</u> <u>1, 2001</u>	Not tested	0.86

Sealed and tested duct systems in new buildingsduct systems System tested after HVAC system installation	(Q total; 25) Total leakage is less than 0.06 Qe	0.96

NG.4.3.8.2 Diagnostic Duct Leakage

Diagnostic duct leakage measurement is used to quantify total leakage for the calculation of air distribution efficiency. To obtain the improved duct efficiency for sealing the duct system, a diagnostic leakage test as described in section NG.4.3.8.2.1 or NG.4.3.8.2.2 must be performed.

Diagnostic duct leakage measurement is used by installers and raters to verify that total leakage meets the criteria for any sealed duct system specified in the compliance documents. Table NG-3 shows the leakage criteria and test procedures that may be used to demonstrate compliance. In addition to the minimum tests shown, existing duct systems may be tested to show they comply with the criteria for new duct systems.

Table NG-3 Duct Leakage Tests

Case	User and Application	<u>Leakage criteria, % of total</u> <u>fan flow</u>	<u>Procedure</u>

	HERS Rater Testing and Verification	And Visual Inspection	RC4.3.7

NG.4.3.8.2.1 Diagnostic Total Duct Leakage Test from Fan Pressurization of Ducts

The objective of this procedure is for an installer to determine or a rater to verify the total leakage of a new or altered duct system. The total duct leakage shall be determined by pressurizing both the supply and return ducts to 25 Pascals with all ceiling diffusers/grilles and HVAC equipment installed. When existing ducts are to be altered, this test shall be performed prior to and after duct sealing. The following procedure shall be used for the fan pressurization tests:

- 1. <u>Verify that the air handler, supply and return plenums and all the connectors, transition pieces, duct boots and registers are installed.</u> The entire system shall be included in the test.
- 2. For newly installed or altered ducts, verify that cloth backed rubber adhesive duct tape has not been used.
- Seal all the supply and return registers, except for one return register or the system fan access. Verify that all outside air dampers and /or economizers are sealed prior to pressurizing the system.
- 2. _Attach the fan flowmeter device to the duct system at the unsealed register or access door.
- 3. Install a static pressure probe at a supply.
- 4. _Adjust the fan flowmeter to produce a 25 Pascal (0.1 in water) pressure difference between the supply duct and the outside or the building space with the entry door open to the outside.
- 5. _Record the flow through the flowmeter ($Q_{\text{total},25}$) this is the total duct leakage flow at 25 Pascals.
- 6. Divide the leakage flow by the total fan flow and convert to a percentage. If the leakage flow percentage is less than 6% for new duct systems or less than 15% for altered duct systems, the system passes.

<u>Duct systems that have passed this total leakage test will be sampled by a HERS rater to show compliance.</u>

When the diagnostic leakage test is performed and the measured total duct leakage is less than 6% of the total fan flow, the duct leakage factor shall be 0.96 as shown in Table NG-2.

NG.4.3.8.2.2 Diagnostic Duct Leakage Using An Aerosol Sealant Closure System

Same procedure as for other closure systems.

<u>3</u>

NG 4.3.8.2.2 Leakage Improvement from Fan Pressurization of Ducts

For altered existing duct systems which have a higher lekage percentage than the Total Duct leakage criteria in Section NG 4.3.8.2.1, the objective of this test is to show that the original leakage is reduced through duct sealing as specified in Table NG-3. The following procedure shall be used:.

- 1. Use the procedure in NG 4.3.8.2.1 to measure the leakage before commencing duct sealing.
- 2. After sealing is complete use the same procedure to measure the leakage after duct sealing.
- 3. Subtract the sealed leakage from the original leakage and divide the remainder by the original leakage. If the leakage reduction is 60% or greater of the original leakage, the system passes.
- 4. Complete the Visual Inspection specified in NG 4.3.8.2.4.

<u>Duct systems that have passed this leakage reduction test and the visual inspection test will be sampled by a HERS rater to show compliance.</u>

NG 4.3.8.2.3 Sealing of All Accessible Leaks

For altered existing duct systems that do not pass the Total Leakage test (NG 4.3.8.2.1), the objective of this test is to show that all accessible leaks are sealed and that excessively damaged ducts have been replaced. The following procedure shall be used:

- 1. Complete each of the leakage tests
- 1. Complete the Visual Inspection as specified in NG 4.3.8.2.4.

All duct systems that could not pass either the total leakage test or the leakage improvement test will be tested by a HERS rater to show compliance. This is a sampling rate of 100%.

NG 4.3.8.2.4 Visual Inspection of Accessible Duct Sealing

For altered existing duct systems that fail to be sealed to 15% of total fan flow, the objective of this inspection is to confirm that all accessible leaks have been sealed and that excessively damaged ducts have been replaced. The following procedure shall be used:

- 1. Visually inspect to verify that the following locations have been sealed:
 - Connections to plenums and other connections to the forced air unit
 - Refrigerant line and other penetrations into the forced air unit
 - Air handler door panel (do not use permanent sealing material, metal tape is acceptable)
 - Register boots sealed to surrounding material
 - Connections between lengths of duct, as well as connections to takeoffs, wyes, tees, and splitter boxes.
- 2. Visually inspect to verify that portions of the duct system that are excessively damaged have been replaced. Ducts that are considered to be excessively damaged are:
 - Flex ducts with the vapor barrier split or cracked with a total linear split or crack length greater than 12 inches
 - Crushed ducts where cross-sectional area is reduced by 30% or more
 - Metal ducts with rust or corrosion resulting in leaks greater than 2 inches in any dimension
 - Ducts that have been subject to animal infestation resulting in leaks greater than 2 inches in any dimension

NG 4.3.8.4 Labeling requirements for tested systems

A sticker shall be at text in 14 point font:	ffixed to the exterior surface of the air ha	andler access door with the f	<u>ollowing</u>
<u>"The leakage of the fan flow.</u>	air distribution ducts was found to be	CFM @ 25 Pascals or	% of total
This system (check	one):		
☐ Has a leakage ratifor new duct systen	te that is equal to or lower than the pre ns or 15% leakage for alterations to exis ments of California Title 24 Energy Effic	ting systems. It meets the	<u>leakage</u>
existing systems. It	nte higher than 6% leakage for new duc does NOT meet the meet or exceed the rever, all accessible ducts were sealed.

	nal conditions for both heating and cooling		3CtiOi i
For heating:			
Equation NG-5	$\underline{\hspace{1cm}} Tamb, s = Tamb, r = Tamb, l$	neat	
For cooling:			
Equation NG-6	$_{\text{L}}$ Tamb, $s = \text{Tamb}$, $r = \text{Tamb}$, $q = \text{Tamb}$	cool	
Where			
Tamb,heat and Tan	nb,cool are determined from values in T	able NG.4.1.	
effectiveness and d	all in the same location, the duct ambier istribution system efficiency calculations of the duct ambient temperatures for hea	shall be determined using a	
Equation NG-7	$T_{amb, heat} = \frac{A_{duct, buffer} \times T_{amb, heat, buffer}}{A_{amb, heat}}$	$+A_{\text{duct,outdoors}} \times T_{\text{amb heat, out}}$ $+A_{\text{duct,outdoors}}$	doors

where the buffer space ambient temperature shall correspond to the location yielding the lowest seasonal delivery effectiveness.

Alternatively, the duct ambient temperature for use in the delivery effectiveness and distribution system efficiency calculations can be determined using an area weighted average of the duct zone temperatures for heating and cooling in all spaces:

$$\underline{\text{Equation NG-9}} T_{amb, heat} = \frac{A_{duct, 1} \times T_{amb \ heat, 1} + A_{duct, 2} \times T_{amb \ heat, 2} + ... + A_n \times T_{amb \ heat, n}}{A_{duct, 1} + A_{duct, 2} + ... + A_{duct, n}}$$

$$\frac{\text{Equation NG-10}}{A_{duct,1} + A_{duct,2}} T_{amb,cool} = \frac{A_{duct,1} \times T_{amb\,cool,1} + A_{duct,2} \times T_{amb\,cool,2} + ... + A_{n} \times T_{amb\,cool,n}}{A_{duct,1} + A_{duct,2} + ... + A_{duct,n}}$$

NG.4.4.2 Seasonal Delivery Effectiveness (DE)

The supply and return conduction fractions, B_s and B_r, shall be calculated as follows:

Equation NG-11
$$P_s = exp \left(\frac{-A_{s,out}}{1.08 Q_e R_s} \right)$$

Equation NG-12
$$B_{r} = exp \left(\frac{-A_{r,out}}{1.08 Q_{e} R_{r}} \right)$$

The temperature difference across the heat exchanger in the following equation is used:

for heating:

Equation NG-13
$$\Delta$$
 T_e = 55 $\frac{(4.8)}{}$

for cooling:

Equation NG-14
$$\Delta T_e = -20 \frac{(4.9)}{}$$

The temperature difference between the building conditioned space and the ambient temperature surrounding the supply, $\Delta\,T_{s,}$ and return, $\Delta\,T_{r}$, shall be calculated using the indoor and the duct ambient temperatures.

Equation NG-15
$$\Delta T_s = T_{in} - T_{amb,s} \frac{(4.10)}{(4.11)}$$
Equation NG-16
$$\Delta T_r = T_{in} - T_{amb,r} \frac{(4.11)}{(4.11)}$$

The seasonal delivery effectiveness for heating or cooling systems shall be calculated using:

Equation NG-17
$$DE_{seasonal} = a_s B_s - a_s B_s (1 - B_r a_r) \frac{\Delta T_r}{\Delta T_e} - a_s (1 - B_s) \frac{\Delta T_s}{\Delta T_e}$$

NG.4.5 Seasonal Distribution System Efficiency

Seasonal distribution system efficiency shall be calculated using delivery effectiveness, equipment, load, and recovery factors calculated for seasonal conditions.

NG.4.5.1 Equipment Efficiency Factor (F_{equip})

F_{equip} is 1.

NG.4.5.2 Thermal Regain (Fregain)

The reduction in building load due to regain of duct losses shall be calculated using the thermal regain factor. The default thermal regain factors are provided in Table NG-3.

Table NG-3 Thermal Regain Factors

Supply Duct Location	Thermal Regain Factor [F _{regain}]
Ceiling/Roof Space	0.10

$$\underline{\text{Equation NG-18}} \qquad F_{regain} = \frac{ZLC_c}{ZLC_{total}} -$$

where:

Equation NG-19
$$ZLC_c = UA_c + 60Q_e(1 - a_r)\rho Cp$$

Equation NG-22
$$Q_{buffer} = 0.038(60)A_{walls}\rho c_p$$
 for non-vented buffer spaces

Equation NG-23
$$Q_{buffer} = 0.25(60)A_{roof} \underline{\rho} \underline{c}_{p}$$
 for -vented buffer spaces

Thermal regain for ducts located outdoors shall be equal to 0.0. If the ducts are not all in the same location, the regain shall be determined using an area weighted average of the regain for heating and cooling:

$$\underline{ \text{Equation NG-24}} \quad F_{regain} = \frac{A_{duct,1} \times F_{regain,1} + A_{duct,2} \times F_{regain,2} + ... + A_{duct,n} \times F_{regain,n}}{A_{duct,1} + A_{duct,2} + ... + A_{duct,n}} \underline{ \quad }$$

NG.4.5.3 Recovery Factor (Frecov)

The recovery factor, F_{recov} , is calculated based on the thermal regain factor, F_{regain} , and the duct losses without return leakage.

$$\underline{ \text{Equation NG-25} } \qquad F_{recov} = 1 + F_{regain} \left(\frac{1 - a_s B_s + a_s B_s (1 - B_r) \frac{\Delta T_r}{\Delta T_e} + a_s (1 - B_s) \frac{\Delta T_s}{\Delta T_e}}{DE_{seasonal}} \right)$$

NG.4.5.4 Seasonal Distribution System Efficiency

The seasonal distribution system efficiency shall be calculated using the seasonal delivery effectiveness from section NG.4.4.2, the equipment efficiency factor from section NG.4.5.1, and the recovery factor from section NG.4.5.3. Note that $DE_{seasonal}$, F_{equip} , F_{recov} must be calculated separately for cooling and heating conditions. Distribution system efficiency shall be determined using the following equation:

Equation NG-26
$$\eta_{dist.seasonal} = 0.98 DE_{seasonal} F_{equip} F_{recov}$$

where 0.98 accounts for the energy losses from heating and cooling the duct thermal mass.

NG.4.6 Hourly Distribution System Efficiency¹

The hourly duct efficiency shall be calculated for each hour using the following equation:

Equation NG-27
$$\eta_{\text{dist,hr}} = \frac{\eta_{\text{dist,seasonal}}}{\eta_{\text{adi,hr}}} \underline{, \eta_{\text{dist,hr}} \le 1}$$

where the hourly efficiency is calculated from the seasonal efficiency and an hourly efficiency adjustment factor. The hourly distribution efficiency shall be less than or equal to 1.0. The hourly duct efficiency adjustment factor shall be calculated from the following equation:

Equation NG-28
$$\eta_{adj,hr} = 1 + C_{DT} \times (\Delta T_{sol,hr} - \Delta T_{sol,season})$$

where the hourly efficiency adjustment factor is calculated from the difference between the hourly roof sol-air temperature and the hourly indoor temperature; the difference between the seasonal average difference between the roof sol-air temperature and the indoor temperature; and a constant derived from regression analysis.

The hourly difference between the roof sol-air temperature and the indoor temperature shall be calculated from the following equation:

Equation NG-29
$$\Delta T_{\text{sol,hr}} = T_{\text{solair,hr}} - T_{\text{in,hr}}$$

The seasonal difference between the roof sol-air temperature and the indoor temperature shall be a load-weighted average of the hourly roof sol-air temperature and the indoor temperature, and shall be calculated from the following equation:

Standard Procedure for Determining the Energy Efficiencies of Single-Zone Nonresidential Air Distribution Systems in <u>Buffer Spaces or Outdoors</u>

Method adapted from Wilcox, B and Brandemuhl, M, "Hourly Attic Duct Efficiency Model for California Homes", PG&E TDV project 2002.

$$\underline{\text{Equation NG-30}} \Delta T_{\text{sol,season}} = \frac{\displaystyle\sum_{\textit{season}} (T_{\text{solair,hr}} - T_{\text{in,hr}}) E_{\text{hr}}}{\displaystyle\sum_{\text{season}} E_{\text{hr}}}$$

The hourly roof sol-air temperature is a function of the hourly ambient temperature, hourly horizontal solar radiation and the roof surface absorptance; and shall be calculated from the following equation:

Equation NG-31
$$T_{\text{solair,hr}} = T_{\text{amb,hr}} + \left(\frac{\alpha}{h_o}\right) I_{\text{hor,hr}} - \Delta T_{\text{sky}}$$

The hourly efficiency adjustment factor regression coefficient shall be calculated from the following equation:

Equation NG-332
$$C_{DT} = C_0 + \frac{C_R}{R_s} + C_L Q_{total,25} : C_{DT,cooling} \ge 0.0; C_{DT,heating} \le 0.0$$

where constants C_0 , C_R , and C_L shall be taken from Table NG-3 according to the season (heating or cooling), and the roof type for ducts in the buffer space (Standard or Cool roof) or duct location (if outdoors). The calculated value of C_{DT} for cooling shall be greater than or equal to zero, and the calculated value of C_{DT} for heating shall be less than or equal to zero.

NG.4.6.3 Hourly Efficiency Adjustment Regression Coefficients and Data

TABLES ARE NOT YET POPULATED, AS RESULTS ARE STILL BEING REVIEWED.

ACM Appendix NH-Test Nonresidential Air Distribution Systems	Page NH-4

ACM NI-2005

Appendix NI₋₋ Alternate Default Fenestration Thermal Properties

Scope

This appendix applies to fenestration excepted from Section 116 (a) 2 and Section 116 (a) 3 of the Standard.

"EXCEPTION to Section 116 (a) 2: If the fenestration product is site-built fenestration in a building covered by the nonresidential standards with less than 10,000 square feet of site-built fenestration or is a skylight, the default U-factor may be the applicable U-factor as set forth in the Nonresidential ACM Manual."

<u>"EXCEPTION to Section 116 (a) 3: If the fenestration product is site-built fenestration in a building covered by the nonresidential standards with less than 10,000 square feet of site-built fenestration or is a skylight, the default SHGC may be calculated according to Equation 116-A."</u>

Purpose

To present alternate default U-factors and the calculation method for determining an alternate default SHGC, and to describe the responsibilities of energy consultants, designers, architects, builders, installers, and building departments when an alternate default value is used for determining compliance.

NI.1 Solar Heat Gain Coefficient

Determination of Solar Heat Gain Coefficients for Fenestration without Certified NFRC Values

This section describes the calculation method, eligibility criteria, and documentation requirements for determining the SHGC of fenestration for which there is no certified NFRC value.

Site-Assembled Fenestration Products and Field-fabricated Fenestration

This section describes the alternative calculation method for determining compliance for site-assembled and field-fabricated products similar to eligible site-built_products.

Site-assembled fenestration includes both field-fabricated fenestration and fenestration whose frame is previously cut or formed by a manufacturer with the specific intention of being used with a glazing assembly to create a complete fenestration product.

Field-fabricated fenestration is a fenestration product whose frame is made at the construction site of standard dimensional lumber or other materials that were not previously cut or otherwise formed with the specific intention of being used to fabricate a fenestration product.

For site-assembled and field-fabricated fenestration, use t<u>T</u>he following equation <u>may be used</u> to calculate the <u>fenestration product's SHGC</u> for fenestration that is used to determine compliance. Convert the center of glass SHGC, SHGC_c, from the manufacturer's documentation to a value for the fenestration product with framing, SHGC_{fen.}

 $SHGC_{fen} = 0.08 + 0.86 \times SHGC_{c}$

Where:

SHGC_{fen} is the SHGC for the fenestration including glass and frame.

SHGC_c is the SHGC for the center of glass alone, and

SHGC_{fen} is the SHGC for the fenestration including glass and frame.

Manufactured Fenestration Products

This section describes the alternative calculation method for determining compliance for manufactured products that do not have SHGC values published by the National Fenestration Rating Council (NFRC) in the NFRC Certified Products Directory.

Manufactured Fenestration Products without a SHGC certified to the NFRC are similar to those that have an SHGC certified to NFRC. They are complete products, shipped from the manufacturer with the frame and glazing already assembled. These products may be listed in the directory with their U-factors, but without an SHGC. As of January 1, 2001, the number of these products is very small and includes only those with non-planar or translucent glazing. To determine compliance with the building efficiency standards, the center of glass SHGC from the manufacturer's documentation must be converted to an SHGC that includes the framing effect. Use the following equation:

SHGC_{fen} = 0.11 + 0.81 x SHGC_c

Where:

SHGC_e is the SHGC for the center of glass alone, and

SHGC_{fen} is the SHGC for the fenestration including glass and frame.

NI.1.2 Responsibilities for <u>SHGC</u> Compliance

This section describes the responsibilities of energy consultants, designers, architects, builders, installers, and building departments when this alternative calculation method is used for determining compliance with SHGC requirements.

NI.1.2.1 Energy Consultants, Designers, Architects

Products with SHGCs Certified to NFRC

SHGCs can be found in the NFRC Certified Products Directory, SV section. Contact NFRC at 301-589-6372 for a copy of the directory or go to NFRC's website at www.nfrc.org for an online database of the directory.

Field-Fabricated Fenestration, Site-Assembled Fenestration and Site-Built Fenestration Products without SHGC Certified to Rated Using NFRC Procedures

The procedure described below <u>applies only to skylights and to site-built fenestration in buildings with less than 10,000 ft² of site-built fenestration.</u>

does not apply to site-assembled vertical glazing in buildings with (a) 100,000 sf or more of conditioned floor area and (b) 10,000 sf or more of vertical fenestration area. For these glazing assemblies, use the NFRC 100SB Label Certificate procedure described above. (For projects where the building has 100,000 sf or more of conditioned space and there is 10,000 sf or more of fenestration area, the SHGC of the vertical glazing must be obtained using NFRC 100SB and must be verified by a Label Certificate for Site-

Built Products. The Label Certificate must be included with the plans or be provided on site at the time of inspection.)

To determine compliance with the efficiency standards, the center of glass SHGC from the manufacturer's documentation for the proposed glazing must be converted to an $SHGC_{fen}$ for the fenestration that includes the framing effect.

For the Prescriptive compliance method, the SHGC_{fen} is then entered into the prescriptive ENV-1 form, Part 2 of 2 and must appear on the building plans.

For the Performance compliance method, the $SHGC_{fen}$ output information printed on the Performance ENV-1 form must be listed on the building plans. The PERF-1 and Performance ENV-1 forms must appear on the plans. The building plan window schedule list must indicate the proposed total $SHGC_{fen}$ values for each fenestration assembly, and these values must be equal to the SHGCs listed on the Performance ENV-1 computer form. (Note: an under-calculation of space conditioning energy can result from entering either too low or too high an $SHGC_{fen}$ for the product.) The proposed design $SHGC_{fen}$ values are entered into the computer program to automatically generate the energy budget of the standard design and the energy use of the proposed design. The building complies if the total energy use of the proposed design is the same or less than the standard design energy budget.

Permit applications must include heat gain documentation for the Building Plan Checker. This documentation must include a copy of the manufacturer's documentation showing the $SHGC_c$, center of glass alone and the calculation used to determine the $SHGC_{fen}$. If the proposed design uses multiple fenestration products or site-assembled fenestration products, a calculation for each different $SHGC_{fen}$ must be attached to the plans along with each glass unit manufacturer's documentation.

<u>Building plans shall identify all site-built fenestration and all site-built fenestration without SHGCs rated using NFRC procedures.</u>

Mixed Fenestration Types

If mixed fenestration is included in the compliance analysis, then the compliance submittal must demonstrate which are certified fenestration products and which are non-certified fenestration or site-built assembled-fenestration products. The manufacturer's documentation and calculations for each product must be included in the submittal, and either the ENV-1 or PERF-1 form must be included on the building plans.

NI.1.2.2 Builder and Installer Responsibilities

The builder is responsible for <u>asen</u> suring that the glass documentation showing the SHGC used for determining compliance is provided to the installer. The builder is responsible for obtaining an NFRC Label Certificate for Site-Built Products for the building's <u>site-built fenestration</u> vertical glazing if the building is 100,000 sf or more and has 10,000 sf tr or more of <u>site-built fenestration</u>. vertical glazing.

The builder is also responsible for asensuring that the persons preparing compliance documentation are specifying products that the builder intends to install. The builder must asensure -that the glazing contractor installs the glass with the same $SHGC_c$ as used for compliance and that the building inspector is provided with manufacturers' documentation showing the $SHGC_c$ for the actual glass product installed. The builder should verify that these fenestration products are clearly shown on the building plans before fenestration products are purchased and installed.

NI.1.2.3 Building Department Responsibilities

Plan Checker

The building department plan checker is responsible for <u>asen</u>suring that the plans identify <u>all site-built</u> fenestration which fenestration is site-assembled and which is not.

The plan-checker is responsible for verifying that <u>for skylights and site-built fenestration using the</u> alternate default SHGC calculation:

- $\underline{\text{1.}}$ the SHGC_{fen} and SHGC_c for non-certified fenestration products or site-assembled products is are identified on the plans, that
- 2. calculations have been provided showing the conversion from SHGCc to SHGCfen, and that
- 3. manufacturer documentation of the SHGC_c has been provided for <u>each of</u> the fenestration <u>products</u> <u>using alternate default SHGC calculations, to be installed and</u>
- 4. the building has less than 10,000 ft² of site-built fenestration.

Plans should be consistent with the compliance documentation, the calculations showing the conversion from SHGC $_c$ to SHGC $_{fen}$, and Prescriptive ENV-1 Part 2 of 2 or Performance ENV-1.

Building Inspector

The building department field inspector is responsible for <u>asen</u>suring that <u>the building using an alternate</u> default SHGC calculation has less than 10,000 ft² of site-built fenestration.

manufacturer's documentation has been provided for the installed fenestration. The inspector is responsible for checking the NFRC label for manufactured fenestration products, or the NFRC 100SB Label Certificate for site-built products where appropriate as described below [see "Energy Consultants, Designers, Architects: Products with SHGCs Certified to NFRC" above].

- 1.All manufactured fenestration products must have either an NFRC label or manufacturer's label with default SHGCs from Table 1-E.
- 2.All site assembled fenestration products in buildings 100,000 sf of conditioned floor area or more and 10,000 sf of vertical fenestration area or more must have either an NFRC Label Certificate for Site Built Fenestration Products or a manufacturer's certificate with a default SHGC from Table 1-E.
- 3.Site_assembled vertical fenestration products in buildings less than 100,000 sf, or buildings with less than 10,000 sf of vertical glazing, may use either of the rating/labeling methods described in (b) above, or the SHGC_{fen} calculation method described in this section.
- 4. Horizontal glazing that does not have a certified NFRC SHGC may use any of the above methods for determining and labeling or certifying the SHGC.

The field inspector is responsible for asensuring that the certified SHGC, or SHGC_c and SHGC_{fen}, for the installed fenestration is consistent with the plans, the Prescriptive ENV-1 Part 2 of 2 or the Performance PERF-1 and Performance ENV-1, and that manufacturer documentation is consistent with the product installed in the building. Plans shall indicate which fenestration is site-assembled or is a fenestration product without SHGCs certified to the NFRC.

NI.2 Thermal Transmittance (U-Factor)

Table NI-1 provides default U-factors for skylights and <u>for</u> site-built fenestration in buildings <u>with less than</u> <u>10,000 ft² of site-built fenestration.</u> <u>covered by the Nonresidential Energy Standards.</u> The default table may be used only for the following:

- ⊟Site-assembled and field-fabricated glazed wall systems in buildings covered by the Nonresidential Energy Standards that have less than 100,000 square feet of conditioned floor area and less than 10,000 square feet of vertical glazing.
- □Skylights in buildings covered by the Nonresidential Energy Standards.
- ∃The default Table NI-1 is consistent with default U-factors published in Table <u>45</u>, Chapter <u>30</u>29, ASHRAE Fundamentals Handbook, <u>2001</u>1997, which is referenced in the Energy Standards. Fenestration products fitting the two descriptions above may still use U-factors obtained through NFRC if available.

NI.2.1 Responsibilities for U-factor Compliance

This section describes the responsibilities of energy consultants, designers, architects, builders, installers, and building departments when Table NI-1 is used for determining compliance with the U-factor requirements of the Efficiency Standards.

NI.2.1.1 Energy Consultants, Designers, Architects

Products with U-factor Certified to NFRC

U-factor values can be found in the NFRC Certified Products Directory. Contact NFRC at 301-589-6372 for a copy of the directory or go to NFRC's website at www.nfrc.org for an online database of the directory.

Field-Fabricated Fenestration, Site-Assembled Fenestration and Fenestration Products Site-Built Fenestration without U-factor Certified to Rated Using NFRC Procedures

The procedure described below applies only to skylights and to site-built fenestration in buildings with less than 10,000 ft² of site-built fenestration. To determine compliance with the efficiency standards, the Glazing Type and Frame Type shown in Table NI-1 must be identified from the manufacturer's documentation for the proposed glazing.

For the Prescriptive compliance method, the U-factor must be selected from Table NI-1 for this Glazing Type and Frame Type and entered into the prescriptive ENV-1 form, Part 2 of 2, and must appear on the <u>building</u> plans.

For the Performance compliance method, the U-factor output information printed on the Performance ENV-1 form must be listed on the building plans. The PERF-1 and Performance ENV-1 forms must appear on the plans. The building plan window schedule list must indicate the proposed total U-factors for each fenestration assembly, and these values must be equal to or less than the U-factors listed on the Performance ENV-1 computer form. The proposed design U-factors are entered into the computer program to automatically generate the energy use of the proposed design. The building complies if the total energy use of the proposed design is the same or less than the standard design energy budget.

Permit applications must include fenestration U-factor documentation for the Building Plan Checker. This documentation must include a copy of the manufacturer's documentation showing the Glazing Type information – number of panes, spacing of panes, glass type, gas fill type, coating emissivity and location – and the Frame Type – frame material type, presence of thermal breaks, and identification of structural glazing (glazing with no frame) that is used to determine the U-factor. If the proposed design uses multiple fenestration products or site-assembled fenestration products, manufacturer's documentation for each different U-factor for each glass unit must be attached to the plans-for each glass unit. Manufacturer's documentation must be provided for each U-factor used for compliance.

<u>Building plans shall identify all site-built fenestration and all site-built fenestration without U-factors rated using NFRC procedures.</u>

Mixed Fenestration Types

If mixed fenestration is included in the compliance analysis, then the compliance submittal must demonstrate which are certified fenestration products and which are non-certified fenestration or site-assembled fenestration products. The manufacturer's documentation and calculations for each product must be included in the submittal, and either the ENV-1 or PERF-1 form must be included on the building plans.

NI.2.1.2 Builder and Installer Responsibilities

The builder is responsible for <u>asen</u>suring that the glass documentation showing the U-factor used for determining compliance is provided to the installer. The builder is responsible for <u>asen</u>suring that the persons preparing compliance documentation are specifying products that the builder intends to install. The builder is also responsible for <u>asen</u>suring that the installer installs glass with <u>U-factors</u> the same <u>or lower than the U-factors</u> <u>as-used for compliance and <u>asen</u>suring that the field inspector for the building</u>

department is provided with manufacturer's documentation showing the U-factor and method of determining U-factor for the actual fenestration product installed. The builder should verify that these fenestration products are clearly shown on the building plans before fenestration products are purchased and installed.

NI.2.1.3 Building Department Responsibilities

Plan Checker

The building department plan checker is responsible for <u>asen</u>suring that the plans identify <u>all site-built</u> <u>fenestration</u>. <u>which fenestration is site-assembled and which is not.</u> The plan-checker is responsible for <u>verifying that the U-factor</u>

<u>The plan checker shall ensure that for skylights and site-built fenestration using alternate default U-factors: non-certified fenestration products or site-assembled products is</u>

- 1. U-factors are identified on the plans, that
- 2. the Glazing Type and Frame Type and Table NI-1 have been provided showing documenting the method of determining the U-factor, and that
- 3. manufacturer documentation of the U-factor-Glazing Type and Frame Type has been provided for the each of the fenestration products using alternate default U-factors, and to be installed.
- 4. the building has less than 10,000 ft² of site-built fenestration.

Plans should be consistent with the compliance documentation, the Glazing Type and Frame Type and Table NI-1 values, and Prescriptive ENV-1 Part 2 of 2 or Performance ENV-1.

Building Inspector

The building department field inspector is responsible for ensuring that the building using an alternate default U-factor has less than 10,000 ft² of site-built fenestration.

The building department field inspector is responsible for <u>assuring ensuring</u> that manufacturer's documentation has been provided for the installed fenestration. The field inspector is responsible for <u>asen</u>suring that the U-factor for the installed fenestration is consistent with the plans, the Prescriptive ENV-1 Part 2 of 2 or the Performance PERF-1, and Performance ENV-1, and that manufacturer documentation is consistent with the product installed in the building.

Plans shall indicate which fenestration is site-assembled or is a fenestration product without U-factor certified to NFRC.

¹ To be eligible, the site-built fenestration must be in a building with less than 10,000 ft² of site-built fenestration.

ACM NJ-2005

Appendix NJ - Acceptance Requirements for Nonresidential Buildings¹

NJ.1 Purpose and Scope

ACM NJ defines acceptance procedures that must be completed before credit can be claimed for certain compliance measures. The procedures apply to nonresidential, high-rise residential and hotel/motel buildings as defined by the California Energy Commission's Energy Efficiency Standards for Nonresidential Buildings.

NJ.2 Introduction

Acceptance Requirements are defined as the application of targeted inspection checks and functional and performance testing conducted to determine whether specific building components, equipment, systems, and interfaces between systems conform to the criteria set forth in the Standards and to related construction documents (plans or specifications). Acceptance Requirements can effectively improve code compliance and help determine whether equipment meets operational goals and whether it should be adjusted to increase efficiency and effectiveness.

This section describes the process for completing the Acceptance Requirements. The steps include the following:

- Document plans showing sensor locations, devices, control sequences and notes,
- Review the installation, perform acceptance tests and document results, and
- Document the operating and maintenance information, complete installation certificate and indicate test results on the Certificate of Acceptance, and submit the Certificate to the building department prior to receive a final occupancy permit.

Acceptance testing is not intended to take the place of commissioning or test and balance procedures that a building owner might incorporate into a building project. It is an adjunct process focusing only on demonstrating compliance with the Standards.

The installing contractor, engineer of record or owners agent shall be responsible for reviewing the plans and specifications to assure they conform to the Acceptance Requirements. This is typically done prior to signing a Certificate of Compliance.

The installing contractor, engineer of record or owners agent shall be responsible for providing all necessary instrumentation, measurement and monitoring, and undertaking all required acceptance requirement procedures. They shall be responsible for correcting all performance deficiencies and again implementing the

Appendix NJ - Acceptance Requirements for Nonresidential Buildings

The New Buildings Institute produced this report for the California Energy Commission under Contract 400-00-043. The project was funded through a Special Energy Projects Grant from the US Department of Energy's Office of Building Technologies, State and Community Programs. Tav Commins is the California Energy Commission Project Manager.

The New Buildings Institute's Jeff Johnson managed this project. Subcontractors on this project were: Portland Energy Conservation, Inc. (Amanda Potter, Tudi Haasl, and Larry Luskay); Don Felts Energy Consultant; and Architectural Energy Consultants (Pete Jacobs).

The following individuals reviewed and advised the project: Jeff Johnson and Mark Williams, New Buildings Institute; Bryan Alcorn, Tav Commins, Jonathan Leber, and Bill Pennington, California Energy Commission; Mark Hydeman, Glenn Friedman and Steve Taylor, Taylor Engineering, Ken Gillespie, Steve Blanc, and Misti Bruceri, PG&E, Mary Ann Piette. LBNL, Charles Eley, Eley Associates, .and Doug Mahone, HMG.

acceptance requirement procedures until all specified systems and equipment are performing in accordance with the Standards.

The installing contractor, engineer of record or owners agent shall be responsible for documenting the results of the acceptance requirement procedures including paper and electronic copies of all measurement and monitoring results. They shall be responsible for performing data analysis, calculation of performance indices and crosschecking results with the requirements of the Standard. They shall be responsible for issuing a Certificate of Acceptance. Building departments shall not release a final Certificate of Occupancy until a Certificate of Acceptance is submitted that demonstrates that the specified systems and equipment have been shown to be performing in accordance with the Standards. The installing contractor, engineer of record or owners agent upon completion of undertaking all required acceptance requirement procedures shall record their State of California Contractor's License number or their State of California Professional Registration License Number on each Certificate of Acceptance that they issue.

NJ.3 Outdoor Air

NJ.3.1 Variable Air Volume Systems Outdoor Air Acceptance

NJ.3.1.1 Construction Inspection

Prior to Acceptance Testing, verify and document the following:

• Outside air flow station is calibrated *OR* a calibration curve of outside air vs. outside air damper position, inlet vane signal, or VFD signal was completed during system TAB procedures.

NJ.3.1.2 Equipment Start-up

Step 1: If the system has an outdoor air economizer, force the economizer high limit to disable economizer control (e.g. for a fixed drybulb high limit, lower the setpoint below the current outdoor air temperature)

Step 2: Drive all VAV boxes to the greater of the minimum airflow or 30% of the total design airflow. Verify and document the following:

- Measured outside airflow CFM corresponds to no less than 90% of the total value found on the Standards Mechanical Plan Check document MECH-3, Column H or Column I (which ever is greater).
- System operation stabilizes within 15 minutes after test procedures are initiated (no hunting).

Step 3: Drive all VAV boxes to achieve design airflow. Verify and document the following:

- Measured outside airflow CFM corresponds to no less than 90% of the total value found on Standards
 Mechanical Plan Check document MECH-3, Column H or Column I (which ever is greater).
- System operation stabilizes within 15 minutes after test procedures are initiated (no hunting).

NJ.3.2 Constant Volume System Outdoor Air Acceptance

NJ.3.2.1 Construction Inspection

Prior to Acceptance Testing, verify and document the following:

• The system has a fixed or motorized minimum outdoor air damper, or an economizer capable of maintaining a minimum outdoor air damper position.

NJ.3.2.2 Equipment Testing

Step 1: If the system has an outdoor air economizer, force the economizer high limit to disable economizer control (e.g. for a fixed drybulb high limit, lower the setpoint below the current outdoor air temperature)

 Measured outside airflow CFM with damper at minimum position corresponds to no less than 90% of the total value found on the Standards Mechanical Plan Check document MECH-3, Column H or Column I (which ever is greater).

NJ.4 Packaged HVAC Systems

Acceptance requirements apply only to constant volume, direct expansion (DX) packaged systems with gas furnaces or heat pumps.

NJ.4.1 Constant Volume Packaged HVAC Systems Acceptance

NJ.4.1.1 Construction Inspection

Prior to Performance Testing, verify and document the following:

- Thermostat is located within the zone that the HVAC system serves.
- Space temperature thermostat is factory-calibrated (proof required) or field-calibrated.
- Appropriate temperature deadband has been programmed.
- Appropriate occupied, unoccupied, and holiday schedules have been programmed.
- Appropriate pre-occupancy purge has been programmed per Standards Section 121(c)2.
- <u>Economizer lockout control sensor, if applicable, is factory-calibrated (proof required) or field-calibrated and setpoint properly set (refer to the ECONOMIZERS acceptance requirements section for detail).</u>
- Demand control ventilation controller, if applicable, is factory-calibrated (proof required) or fieldcalibrated and setpoint properly set (refer to the DEMAND CONTROL VENTILATION acceptance requirements section for detail).

NJ.4.1.2 Equipment Testing

<u>Step 1: Simulate heating load during occupied condition (e.g. by setting time schedule to include actual time</u> and placing thermostat heating setpoint above actual temperature). Verify and document the following:

- Supply fan operates continually during occupied condition.
- Gas-fired furnace, heat pump or electric heater, if applicable, stages on.
- No cooling is provided by the unit.
- Outside air damper is open to the minimum position.

Step 2: Simulate "no-load" during occupied condition (e.g. by setting time schedule to include actual time and placing thermostat heating setpoints below actual temperature and cooling setpoint below actual temperature). Verify and document the following:

- Supply fan operates continually during occupied condition.
- Neither heating or cooling is provided by the unit.
- Outside air damper is open to the minimum position.

Step 3: If there is an economizer, simulate cooling load and economizer operation, if applicable, during occupied condition (e.g. by setting time schedule to include actual time and placing thermostat cooling setpoint below actual temperature). Verify and document the following:

- Supply fan operates continually during occupied condition.
- Refer to the ECONOMIZERS acceptance requirements section for testing protocols.
 - No heating is provided by the unit.

Step 4: If there is no economizer, simulate cooling load during occupied condition (e.g. by setting time schedule to include actual time and placing thermostat cooling setpoint below actual temperature). Verify and document the following:

- Supply fan operates continually during occupied condition.
- Compressor(s) stage on.
- No heating is provided by the unit.
- Outside air damper is open to the minimum position.

Step 5: Change the time schedule force the unit into unoccupied mode. Verify and document the following:

- Supply fan turns off.
- Outside air damper closes completely.

Step 6: Simulate heating load during setback conditions (e.g. by setting time schedule to exclude actual time and placing thermostat setback heating setpoint above actual temperature). Verify and document the following:

- Supply fan cycles on.
- Gas-fired furnace, heat pump or electric heater, if applicable, stages on.
- No cooling is provided by the unit.
- Supply fan cycles off when heating equipment is disabled.

Step 7: If there is an economizer, simulate cooling load and economizer operation, if applicable, during unoccupied condition (e.g. by setting time schedule to exclude actual time and placing thermostat setup cooling setpoint below actual temperature). Verify and document the following:

- Supply fan cycles on.
- Refer to the ECONOMIZERS acceptance requirements section for testing protocols.
- Supply fan cycles off when call for cooling is satisfied (simulated by lowering the thermostat setpoint to below actual temperature).
- Outside air damper closes when unit cycles off.

Step 8: If there is no economizer, simulate cooling load during setup condition (e.g. by setting time schedule to exclude actual time and placing thermostat setup cooling setpoint above actual temperature). Verify and document the following:

- Supply fan cycles on.
- Compressor(s) stage on to satisfy cooling space temperature setpoint.
- No heating is provided by the unit.
- Supply fan cycles off when cooling equipment is disabled.

Step 9: Simulate manual override during unoccupied condition (e.g. by setting time schedule to exclude actual time or by pressing override button). Verify and document the following:

- System reverts to "occupied" mode and operates as described above to satisfy a heating, cooling, or no load condition.
- System turns off when manual override time period expires.

NJ.5. Air Distribution Systems

Acceptance requirements apply only to systems covered by Section 144(k).

NJ.5.1 Air Distribution Acceptance

NJ.5.1.1 Construction Inspection

Prior to Performance Testing, verify and document the following:

- Drawbands are either stainless steel worm-drive hose clamps or UV-resistant nylon duct ties.
- Flexible ducts are not constricted in any way (for example pressing against immovable objects or squeezed through openings).
- Duct leakage tests shall be performed before access to ductwork and associated connections are blocked by permanently installed construction material.
- Joints and seams are not sealed with a cloth back rubber adhesive tape unless used in combination with mastic and drawbands.
- Duct R-values are verified.
- Insulation is protected from damage and suitable for outdoor service if applicable.

NJ.5.1.2 Equipment Testing

<u>Step 1: Perform duct leakage test per 2003 Nonresidential ACM Approved Manual, Appendix NG, Section 4.3.8.2. Certify the following:</u>

Duct leakage conforms to the requirements of Section 144(k)...

Step 2: Obtain HERS Rater field verification as required by Chapter 7 and Appendix NG.

NJ.6. Lighting Control Systems

<u>Lighting control testing is performed on:</u>

- Manual Daylighting Controls.
- Automatic Daylighting Controls.
- Occupancy Sensors.
- Automatic Time-switch Control.

NJ.6.1 Automatic Daylighting Controls Acceptance

NJ.6.1.1 Construction Inspection

<u>Prior to Performance Testing, verify and document the following:</u>

- All control devices (photocells) have been properly located, factory-calibrated (proof required) or field-calibrated and set for appropriate set points and threshold light levels.
- Installer has provided documentation of setpoints, setting and programming for each device.
- <u>Luminaires located in either a horizontal daylit area(s) or a vertical daylit area(s) are powered by a separate lighting circuit from non-daylit areas.</u>

NJ.6.1.2 Equipment Testing

Continuous Dimming Control Systems

<u>Step 1: Simulate bright conditions for a continuous dimming control system. Verify and document the following:</u>

- Lighting power reduction is at least 65% under fully dimmed conditions.
- At least one control step reduces the lighting power by at least 30%.
- Only luminaires in daylit zone are affected by daylight control.
- Automatic daylight control system reduces the amount of light delivered to the space uniformly.
- Dimming control system provides reduced flicker operation over the entire operating range per Standards Section 119(e)2.
- Lumen measurements in the space, location of measurements and specific device settings, program settings and other measurements are documented.

Step 2: Simulate dark conditions for a continuous dimming control system. Verify and document the following:

- Automatic daylight control system increases the amount of light delivered to the space uniformly.
- Dimming control system provides reduced flicker operation over the entire operating range per Standards Section 119(e)2.
- Lumen measurements in the space, location of measurements and specific device settings, program settings and other measurements are documented.

Stepped Dimming Control Systems

Step 1: Simulate bright conditions for a stepped dimming control system. Verify and document the following:

- Lighting power reduction is at least 50% under fully dimmed conditions.
- Only luminaires in daylit zone are affected by daylight control.
- Automatic daylight control system reduces the amount of light delivered to the space relatively uniformly as per Section 131(b).
- Automatic daylight control system reduces the amount of light delivered to the space per manufacturer's specifications for power level verses light level.
- Minimum time delay between step changes is 3 minutes to prevent short cycling.
- Lumen measurements in the space, location of measurements and specific device settings, program settings and other measurements are documented.

Step 2: Simulate dark conditions for a stepped dimming control system. Verify and document the following:

- Automatic daylight control system increases the amount of light delivered to the space per manufacturer's specifications for power level verses light level.
- Stepped dimming control system provides reduced flicker over the entire operating range per Standards Section 119(e)2.
- Minimum time delay between step changes is 3 minutes to prevent short cycling.
- Lumen measurements in the space, location of measurements and specific device settings, program settings and other measurements are documented.

Stepped Switching Control Systems

Step 1: Simulate bright conditions for a stepped switching control system. Verify and document the following:

- Lighting power reduction is at least 50% under fully switched conditions per Standards Section 119(e)1.
- Only luminaires in daylit zone are affected by daylight control.
- Automatic daylight control system reduces the amount of light delivered to the space relatively uniformly as per Section 131(b).
- Automatic daylight control system reduces the amount of light delivered to the space per manufacturer's specifications for power level verses light level.
- Single- or multiple-stepped switching controls provide a dead band of at least three minutes between switching thresholds to prevent short cycling.
- Lumen measurements in the space, location of measurements and specific device settings, program settings and other measurements are documented.

Step 2: Simulate dark conditions for a stepped switching control system. Verify and document the following:

- Automatic daylight control system increases the amount of light delivered to the space per manufacturer's specifications for power level verses light level.
- Single- or multiple-stepped switching controls provide a dead band of at least three minutes between switching thresholds to prevent short cycling.
- Lumen measurements in the space, location of measurements and specific device settings, program settings and other measurements are documented.

NJ.6.2 Occupancy Sensor Acceptance

NJ.6.2.1 Construction Inspection

Prior to Performance Testing, verify and document the following:

- Occupancy sensitivity has been located to minimize false signals.
- Occupancy sensors do not encounter any obstructions that could adversely affect desired performance.
- Ultrasound occupancy sensors do not emit audible sound.

NJ.6.2.2 Equipment Testing

Step 1: For a representative sample of building spaces, simulate an unoccupied condition. Verify and document the following:

- Lights controlled by occupancy sensors turn off within a maximum of 30 minutes from the start of an unoccupied condition per Standard Section 119(d).
- The occupant sensor does not trigger a false "on" from movement in an area adjacent to the controlled space or from HVAC operation.
- Signal sensitivity is adequate to achieve desired control.

Step 2: For a representative sample of building spaces, simulate an occupied condition. Verify and document the following:

- Status indicator or annunciator operates correctly.
- <u>Lights controlled by occupancy sensors turn on immediately upon an occupied condition, OR sensor indicates space is "occupied" and lights are turned on manually (automatic OFF and manual ON control strategy).</u>

NJ.6.3 Manual Daylighting Controls Acceptance

NJ.6.3.1 Construction Inspection

Prior to Performance Testing, verify and document the following:

• If dimming ballasts are specified for light fixtures within the daylit area, make sure they meet all the Standards requirements, including "reduced flicker operation" for manual dimming control systems.

NJ.6.3.2 Equipment Testing

Step 1: Perform manual switching control. Verify and document the following:

- Manual switching or dimming achieves a lighting power reduction of at least 50%.
- The amount of light delivered to the space is uniformly reduced.

NJ.6.4 Automatic Time Switch Control Acceptance

NJ.6.4.1 Construction Inspection

Prior to Performance Testing, verify and document the following:

- Automatic time switch control is programmed with acceptable weekday, weekend, and holiday (if applicable) schedules.
- Document for the owner automatic time switch programming including weekday, weekend, holiday schedules as well as all set-up and preference program settings.
- Verify the correct time and date is properly set in the time switch.
- Verify the battery is installed and energized.
- Override time limit is no more than 2 hours.

NJ.6.4.2 Equipment Testing

Step 1: Simulate occupied condition. Verify and document the following:

All lights can be turned on and off by their respective area control switch.

• Verify the switch only operates lighting in the ceiling-height partitioned area in which the switch is located.

Step 2: Simulate unoccupied condition. Verify and document the following:

- All non-exempt lighting turn off per Section 131 (d)1.
- Manual override switch allows only the lights in the selected ceiling height partitioned space where the
 override switch is located, to turn on or remain on until the next scheduled shut off occurs.
- All non-exempt lighting turns off.

NJ.7. Air Economizer Controls

Economizer testing is performed on all built-up systems and on packaged systems per Standards Section 144 (e)1. Air economizers installed by the HVAC system manufacturer and certified to the commission as being factory calibrated and tested do not require field testing.

NJ.7.1 Economizer Acceptance

NJ.7.1.1 Construction Inspection

Prior to Performance Testing, verify and document the following:

- Economizer lockout setpoint complies with Table 144-C per Standards Section 144 (e) 3.
- System controls are wired correctly to ensure economizer is fully integrated (i.e. economizer will operate when mechanical cooling is enabled).
- Economizer lockout control sensor location is adequate (open to air but not exposed to direct sunlight nor in an enclosure; away from sources of building exhaust; at least 25 feet away from cooling towers).
- Relief fan system (if applicable) operates only when the economizer is enabled.
- If no relief fan system is installed, barometric relief dampers are installed to relieve building pressure when the economizer is operating.

NJ.7.1.2 Equipment Testing

Step 1: Simulate a cooling load and enable the economizer by adjusting the lockout control (fixed or differential dry-bulb or enthalpy sensor depending on system type) setpoint. Verify and document the following:

- Economizer damper modulates opens per Standards Section 144 (e)1A to maximum position to satisfy cooling space temperature setpoint.
- Return air damper modulates closed and is completely closed when economizer damper is 100% open.
- Economizer damper is 100% open before mechanical cooling is enabled.
- Relief fan is operating or relief dampers freely swing open.
- Mechanical cooling is only enabled if cooling space temperature setpoint is not met with economizer at 100% open.
- Doors are not pushed ajar from over pressurization.

Step 2: Continue from Step 1 and disable the economizer by adjusting the lockout control (fixed or differential dry-bulb or enthalpy sensor depending on system type) setpoint. Verify and document the following:

• Economizer damper closes to minimum position.

- Return air damper opens to normal operating position.
- Relief fan shuts off or relief dampers close.
- Mechanical cooling remains enabled until cooling space temperature setpoint is met.

NJ.8. Demand Control Ventilation (DCV) Systems

Demand control ventilation is tested on package systems per Standards Section 121 (c)3.

NJ.8.1 Packaged Systems DCV Acceptance

NJ.8.1.1 Construction Inspection

Prior to Performance Testing, verify and document the following:

- Carbon dioxide control sensor is factory calibrated (proof required) or field-calibrated with an accuracy
 of no less than 75 ppm.
- The sensor is located in the room between 1ft and 6 ft above the floor.
- System controls are wired correctly to ensure proper control of outdoor air damper system.

NJ.8.1.2 Equipment Testing

Step 1: Simulate a high CO2 load and enable the demand control ventilation by adjusting the demand control ventilation controller setpoint below ambient CO2 levels. Verify and document the following:

 Outdoor air damper modulates opens per Standards to maximum position to satisfy outdoor air requirements specified in Section 121 (c)4, Equation 121-A.

<u>Step 2</u>: Continue from Step 1 and disable demand control ventilation by adjusting the demand control ventilation controller setpoint above ambient CO2 levels. Verify and document the following:

Outdoor air damper closes to minimum position.

NJ.9. Variable Frequency Drive Systems

NJ.9.1 Supply Fan Variable Flow Controls

NJ.9.1.1 Construction Inspection

Prior to Performance Testing, verify and document the following:

- Discharge static pressure sensor is factory calibrated (proof required) or field-calibrated with secondary source.
- Disable discharge static pressure reset sequences to prevent unwanted interaction while performing tests.

NJ.9.1.2 Equipment Testing

Step 1: Drive all VAV boxes to achieve design airflow. Verify and document the following:

- Witness proper response from supply fan (e.g. VFD ramps up to full speed; inlet vanes open full).
- Supply fan maintains discharge static pressure within +/-10% of setpoint.
- Measured maximum airflow corresponds to design and/or TAB report within +/-10%.

• System operation stabilizes within a reasonable amount of time after test procedures are initiated (no hunting).

Step 2: Drive all VAV boxes to minimum flow or to achieve 30% total design airflow whichever is larger. Verify and document the following:

- Witness proper response from supply fan (VFD slows fan speed; inlet vanes close).
- Supply fan maintains discharge static pressure within +/-10% of setpoint.
- System operation stabilizes within a reasonable amount of time after test procedures are initiated (no hunting).

NJ.10. Hydronic System Controls Acceptance

Hydronic controls Acceptance Testing will be performed on:

- Variable Flow Controls
- Automatic Isolation Controls
- Supply Water Temperature Reset Controls
- Water-loop Heat Pump Controls
- Variable Frequency Drive Control

NJ.10.1 Variable Flow Controls

NJ.10.1.1 Construction Inspection

Prior to Acceptance Testing, verify and document the following:

- Valve and piping arrangements were installed per the design drawings to achieve flow reduction requirements.
- Installed valve and hydronic connection pressure ratings meet specifications.
- Installed valve actuator torque characteristics meet specifications.

NJ.10.1.2 Equipment Testing

Step 1: Open all control valves. Verify and document the following:

• System operation achieves design conditions.

Step 2: Initiate closure of control valves. Verify and document the following:

- The design pump flow control strategy achieves flow reduction requirements.
- Ensure all valves operate correctly against the minimum flow system pressure condition.

NJ.10.2 Automatic Isolation Controls

NJ.10.2.1 Construction Inspection

Prior to Acceptance Testing, verify and document the following:

- Valve and piping arrangements were installed per the design drawings to achieve equipment isolation requirements.
- Installed valve and hydronic connection pressure ratings meet specifications.
- Installed valve actuator torque characteristics meet specifications.

NJ.10.2.2 Equipment Testing

- Step 1: Open all control valves. Verify and document the following:
 - System operation achieves design conditions.
- Step 2: Initiate shut-down sequence on individual pieces of equipment. Verify and document the following:
 - The design control strategy meets isolation requirements automatically upon equipment shut-down.
 - Ensure all valves operate correctly at shut-off system pressure conditions.

NJ.10.3 Supply Water Temperature Reset Controls

NJ.10.3.1 Construction Inspection

Prior to Acceptance Testing, verify and document the following:

- ALL SENSORS HAVE BEEN CALIBRATED.
- Sensor locations are adequate to achieve accurate measurements.
- Installed sensors comply with specifications.

NJ.10.3.2 Equipment Testing

- Step 1: Manually change design control variable to maximum setpoint. Verify and document the following:
 - Chilled or hot water temperature setpoint is reset to appropriate value.
 - Actual supply temperature changes to meet setpoint.
- Step 2: Manually change design control variable to minimum setpoint. Verify and document the following:
 - Chilled or hot water temperature setpoint is reset to appropriate value.
 - Actual supply temperature changes to meet setpoint.

NJ.10.4 Water-loop Heat Pump Controls

NJ.10.4.1 Construction Inspection

Prior to Acceptance Testing, verify and document the following:

- Valves were installed per the design drawings to achieve equipment isolation requirements.
- Installed valve and hydronic connection pressure ratings meet specifications.
- Installed valve actuator torque characteristics meet specifications.
- All sensor locations comply with design drawings.
- All sensors are calibrated.
- VFD minimum speed setpoint exceeds motor manufacturer's requirements.
- VFD minimum speed setpoint should not be set below the pumping energy curve inflection point (i.e. combination of pump-motor-VFD efficiency at reduced load may cause power requirements to increase upon further reduction in load).

NJ.10.4.2 Equipment Testing

Step 1: Open all control valves. Verify and document the following:

- System operation achieves design conditions +/- 5%.
- VFD operates at 100% speed at full flow conditions.

Step 2: Initiate shut-down sequence on each individual heat pumps. Verify and document the following:

- Isolation valves close automatically upon unit shut-down.
- Ensure all valves operate correctly at shut-off system pressure conditions.
- Witness proper response from VFD (speed decreases as valves close).
- System operation stabilizes within 5 minutes after test procedures are initiated (no hunting).

Step 3: Adjust system operation to achieve 50% flow. Verify and document the following:

VFD input power less than 30% of design.

Step 4: Adjust system operation to achieve a flow rate that would result in the VFD operating below minimum speed setpoint. Verify and document the following:

• Ensure VFD maintains minimum speed setpoint regardless of system flow operating point.

NJ.10.5 Variable Frequency Drive Controls

NJ.10.5.1 Construction Inspection

Prior to Acceptance Testing, verify and document the following:

- All valves, sensors, and equipment were installed per the design drawings.
- All installed valves, sensors, and equipment meet specifications.
- All sensors are calibrated.
- VFD minimum speed setpoint exceeds motor manufacturer's requirements.
- VFD minimum speed setpoint should not be set below the pumping energy curve inflection point (i.e. combination of pump-motor-VFD efficiency characteristics at reduced load may cause input power to increase upon further reduction in load).

NJ.10.5.2 Equipment Testing

Step 1: Open all control valves. Verify and document the following:

- System operation achieves design conditions +/- 5%.
- VFD operates at 100% speed at full flow conditions.

Step 2: Modulate control valves closed. Verify and document the following:

- Ensure all valves operate correctly at system operating pressure conditions.
- Witness proper response from VFD (speed decreases as valves close).
- System operation stabilizes within 5 minutes after test procedures are initiated (no hunting).

Step 3: Adjust system operation to achieve 50% flow. Verify and document the following:

• VFD input power less than 30% of design.

Step 4: Adjust system operation to achieve a flow rate that would result in the VFD operating below minimum speed setpoint. Verify and document the following:

• Ensure VFD maintains minimum speed setpoint regardless of system flow operating point.
